1.0 EXECUTIVE SUMMARY / PROJECT ABSTRACT

1.1 Project Goals and Objectives

The Hockett Dairy Buffer Mitigation Project is located in the 03030003 Catalog Unit (CU), in the Cape Fear River Basin. Assets of this CU include the Deep River, the Randleman Reservoir, and major communities including High Point, Asheboro, Siler City, and Sanford. Restoration goals for CU 03030003 as identified in the 2009 Cape Fear River Basin RBRP include protection of several species of mussel and the Cape Fear Shiner (*Notropis mekistocholas*). Additional goals include the improvement in water quality to waters draining to Randleman Reservoir.

The Hockett Dairy Buffer Mitigation Project was identified as an opportunity to improve water quality and habitat within the CU. The project goals address stressors identified in the CU. The following table lists the project goals and the project objectives through which the goals will be addressed:

| Goals | Objectives |
|------------------------------|--|
| 1. Nutrient removal | • Restore minimum 50-foot riparian buffer by planting |
| 2. Sediment removal | appropriate bottomland hardwood species to filter runoff. |
| 3. Runoff filtration | • Convert active farm fields to forested buffers. |
| 4. Increase dissolved oxygen | • Plant buffer vegetation to shade channel. |
| concentration | • Restore riparian buffer habitat to appropriate bottomland |
| 5. Restore riparian habitats | hardwood ecosystem. |
| 6. Reduce water temperature | • Restore canopy tree species in the stream buffer areas to shade channel. |
| | • Eliminate and control exotic invasive species. |
| | • Replace two undersized and failing channel crossings with |
| | appropriately sized culverts or ford. |
| | • Stabilize two small dams on small farm ponds. |

1.2 Project Background

The Hockett Dairy Riparian Buffer Mitigation Site is located on Hockett Dairy Road (SR 1938) in Randolph County approximately 12 miles north of Asheboro, NC (**Figure 1**). The site is located in the Cape Fear River Basin within Cataloging Unit 03030003010070 (NCDWQ sub-basin 03-06-08). The site has five unnamed tributaries (UT) that drain into Randleman Lake. The project consists of 11.82 acres of buffer restoration.

The Hockett Dairy Buffer site is located in the Piedmont Physiographic Province and in the Carolina Slate Belt. The region is underlain by felsic metavolcanic rocks, which can be seen in the streambed of UT 2 and UT 3. The topography of the project area is generally rolling with elevations ranging from 670 to 760 feet. The five unnamed tributaries to Randleman Lake comprise the principle drainage features. These tributaries have limited hardwood trees present within the buffer and lack significant ground cover. The mature trees are less than 100 stems per acres. The project's watershed is primarily used for agricultural production. Much of the surrounding land use is currently dairy cows and calves or row crop production for dairy silage. Cattle have direct access to streams channels and ponds and are a source of ongoing erosion along the banks and within the adjacent buffer. Cattle are excluded from some channels with fencing on or near the top of bank, resulting in a degraded riparian buffer. The project area has been in agricultural use for several decades.

The Hockett Dairy mitigation project provides high quality riparian buffer restoration. Stream buffer mitigation for the Hockett Dairy Site involved buffering five streams that flow directly and indirectly into

Randleman Lake. The mitigation design divides the site into five distinct reaches (**Figure 2**). Buffer restoration was performed along five channels. Two undersized and failing channel crossings were replaced with appropriately sized culverts to prevent erosion. Two small dams on small farm ponds have been stabilized.

1.3 Vegetation Condition

The measure of vegetative success for the site is the survival of at least 320 five-year old planted trees per acre at the end of year five of the monitoring period. CVS Level was performed in Year 2 to document any volunteer generation. A total of 4 volunteers were observed across all 12 vegetation plots. Year 2 monitoring recorded an average of 523 planted stems per acre and 536 total stems per acre (planted and volunteers) across all vegetation plots. Plots 2, 6, and 7 each had less than 300 stems per acre. All other plots achieved success criteria in Year 2. Vegetation issues included invasive species (Johnsongrass, *Sorghum halepense*) along portions of UT 4 and vegetation trampled by cattle near Plot 2. The cattle had gained access to the easement prior to Year 1 monitoring when a tree fell onto the fence near Plot 2. This fence was repaired prior to year 1 monitoring and the cattle have been excluded. The plot may need to be replanted to meet success criteria. Overall, vegetation across the site is in good condition. The Current Condition Plan View is provided in **Appendix B**, **Figure 2**.

1.4 Summary Information / Data

Summary information/data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the Baseline Monitoring Report (formerly Mitigation Plan) and in the Mitigation Plan (formerly the Restoration Plan) documents available on EEP's website. All raw data supporting the tables and figures in the appendices is available from EEP upon request.

2.0 METHODOLOGY

In order to determine if the success criteria are achieved and the planted areas are developing toward the target community, NCEEP-CVS Protocol for Recording Vegetation Version 4.2 will be utilized. The vegetation monitoring will include Level I and Level II plots distributed across the planted area. An interim vegetation monitoring will occur in spring after leaf-out has occurred. The CVS monitoring will be conducted toward the end of the growing season. Individual plot data will be provided to NCEEP and CVS following NCEEP-CVS guidance. The annual monitoring requirements are summarized in the following table:

| Required | Parameter | Quantity | Frequency | Notes |
|----------|--------------------------------------|---|-------------|---|
| x | Vegetation | 12 Plots Located randomly across the project area | Annual | Vegetation will be monitored using the Carolina Vegetation Survey (CVS) protocols |
| X | Exotic and nuisance vegetation | N/A | Semi-Annual | Exotic vegetation will be evaluated and spot treatment applied as needed |
| x | Project boundary | N/A | Semi-annual | Locations of fence damage, vegetation damage, boundary encroachments, etc. will be mapped |

Photographs will be used to visually document restoration success. Reference photos will be taken once a year and will be used to visually document restoration success. Reference photo stations are marked with

wooden stakes. Reference stations will be photographed immediately following planting and continued annually for at least five years following construction. Photographers will make every effort to maintain the same area in each photo over time. Photographs will be used to subjectively evaluate vegetation establishment. A series of photos over time should indicate successional maturation of riparian vegetation.
