## **1.0 PROJECT SUMMARY**

The NCDEQ Division of Mitigation Services (DMS) restored, enhanced, and preserved approximately 19,677 linear feet (LF) of Moores Fork and thirteen previously unnamed tributaries (UTs), provided livestock fencing and alternative water sources to keep livestock out of the streams, removed invasive plant species across the project, and established native riparian buffers. The restoration project was developed to fulfill stream mitigation requirements accepted by the DMS for the Upper Yadkin River Basin (HUC 03040101). The Moores Fork Stream Restoration Project will net 11,736 stream mitigation credits through a combination of restoration, enhancement I and II, and preservation. This report documents the results of the As-Built Baseline monitoring efforts (MY0).

## 1.1 Project Goals

The project goals identified in the Mitigation Plan (Confluence, 2012) include:

- Improve water quality in Moores Fork and the UTs through reductions in sediment and nutrient inputs from local sources;
- Create conditions for dynamic equilibrium of water and sediment movement between the supply reaches and project reaches;
- Promote floodwater attenuation and secondary functions associated with more frequent and extensive floodwater contact times;
- Improve in-stream habitat by increasing the diversity of bedform features;
- Enhance and protect native riparian vegetation communities; and
- Reduce fecal, nutrient, and sediment loads to project streams by promoting and implementing livestock best management practices.

## **1.2 Project Performance Standards**

The performance of the project will be evaluated in accordance with the geomorphic, visual, hydrology, and vegetation components outlined in the Stream Mitigation Guidelines (USACE 2003). The following are specific performance standards from the approved Mitigation Plan (Confluence, 2012).

Performance Standards									
Parameter Metrics/Success Criteria									
	a. Bank height ratio for reaches where BHR is corrected through design and construction shall not exceed 1.2.								
Channel Stability	b. Entrenchment ratio for reaches where ER is corrected through design and construction shall be no less than 2.2.								
	c. The stream project shall remain stable and all other performance standards shall be met through two separate bankfull events, occurring in separate years, during the monitoring years 1 through 7.								

1

Riparian Buffer Vegetation	a. Density of 320 live, planted stems/acre at year 3; 260 live, planted stems/acre at year 5; 210 live planted stems/acre at year 7.
	b. Planted vegetation must average 8 feet in height at year 7.

## **1.3** Project Setting and Background

The site is located in the Piedmont physiographic province (NCGS 2004). The Piedmont is characterized by gently rolling, well rounded hills and long low ridges. Moores Fork is a tributary to Stewarts Creek in the Upper Yadkin River Basin (HUC 03040101). The site is located approximately 0.25 mile north of NC 89 on Horton Road. The project site is located on both sides of Horton Road. Latitude and longitude for the site are 36.506671 N and -80.704115 W, respectively. A site location map is included in Appendix A as Figure 1.

Agriculture is the primary land use in the watershed (36% agriculture land cover). Degraded buffers and livestock operations were identified as major stressors to water quality within the watershed. The site assessment phase of the project identified other stressors as well, including elevated water temperatures, excessive nutrient inputs, channel incision, bank erosion, and sediment deposition. Dairy and farming operations on the site have deforested riparian buffers and allowed direct livestock access to the stream, leading to elevated temperatures and nutrients. Channel straightening and dredging throughout much of the project has also contributed to channel degradation.

## **1.4 Project Components and Approach**

Stream restoration was accomplished using a natural channel design approach to restore appropriate channel dimension, pattern, and profile (Table 1; Figure 2). These improved conditions will promote water and sediment transport equilibrium between the stream and its watershed, reconnect the stream to its floodplain, and promote healthy in-stream and riparian habitats. The project goals were addressed through the following project objectives:

- Restoration of the dimension, pattern, profile of approximately 1,875 LF of Moores Fork Reach 2 and 243 LF of the Pond Tributary;
- Restoration of the dimension and profile (Enhancement I) of the channel for approximately 2,885 LF of Moores Fork Reach 3, 900 LF of Silage Reach 1, 2,448 LF of Silage Reach 2, 350 LF of Barn Reach 1 and 112 LF of Corn Reach 2;
- Limited channel work coupled with livestock exclusion, gully stabilization, invasive species control and buffer planting (Enhancement II) on approximately 761 LF of Moores Fork Reach 1, 167 LF of Cow Tributary 1, 767 LF of Cow Tributary 2, 3,084 LF of Barn Reach 2, 1,340 LF of Corn Reach 1, and 466 LF of UT 1;
- Livestock exclusion fencing and other best management practice installations;

2

- Invasive plant species control measures across the entire project wherever necessary; and
- Preservation of approximately 4,279 LF of relatively un-impacted forested streams (UTs 2, 3,6,7,8,9,10) in a permanent conservation easement.

The target stream type for Moores Fork was a moderately sinuous, moderate width-depth ratio C4, which was appropriate for the relatively flat and wide alluvial valley. Reach 2 of Moores Fork was constructed mainly off-line to position the channel in the low point of the valley and provide much improved floodplain access on both banks. Reach 3 was constructed largely within the existing channel with modest pattern shifts where existing pattern was unstable. In-stream structures were incorporated in Reach 3 to promote sediment transport equilibrium, riffle and pool formation, and enhanced bank stability. The overall approach can be described as a hybrid Rosgen Priority 2/3 restoration.

Due to the slope and confined valley, Reach 1 of the Silage Tributary was designed as a step-pool, B4 stream type. Because of the highly confined nature of the Silage Tributary and the desire to preserve mature upland trees, addressing eroding banks and incised conditions through bank sloping was not practical. The design solution was to create a new step pool profile within the original channel and stabilize the upper banks with facsinces, a bioengineering technique that involves placing dormant woody cuttings in shallow, contour-line trenches.

Reach 2 of the Silage Tributary, the Corn Reach, and the Barn Reach were similar in terms of morphology; each was a relatively steep alluvial channel with significant incision and bank erosion problems with little length to transition to a stable profile end point. The design approaches for these streams was also similar. The channels were left in their current alignments, banks were graded to stable slopes, bankfull benches were constructed, and in-stream structures were used to promote bed and bank stability. Reference cross-sections on stable reaches of the Corn and Barn Reaches were used to size the design cross-sections for these streams.

The target stream type for the Pond Tributary was a moderately sinuous, moderate width-depth ratio C4. The project reach begins at the outlet of the culvert where flow drops approximately two feet to a small plunge pool at the existing thalweg. The design profile started at this existing thalweg elevation, taking advantage of the energy dissipating effects of the pool, and then abandoned the badly trampled channel for a new alignment across the floodplain to the east. The downstream end of the profile included a 1.5-foot high transition to the Moores Fork thalweg, which was constructed using a grade control structure.

The project also included filling and stabilizing gullies at the headwaters of the Silage Tributary, the Cow 1 and Cow 2 Tributaries, UT1 and two runoff conveyances entering Moores Fork Reach 3. The proposed gully stabilization included upland measures such as temporary silt fences, swales and vegetation to divert and/or redirect runoff away from gullies. Check dams made from riprap, woody brush, recycled crushed concrete, decay resistant logs, and other on-site materials were used to reduce erosive

stresses in the gullies and promote healing. Stabilized areas were planted with native species at densities specified for buffer areas.

The final design was completed in June of 2013. Construction activities and as-built surveys were completed in December of 2014. Planting of the site took place in March of 2015. A large flood event with an estimated return interval of 50 to 100 years occurred at the site on April 18-19, 2015, causing damage to the main stem of Moores Fork. This damage was repaired in March and April 2016, and a second as-built survey was performed on the repaired areas in April 2016. The baseline monitoring efforts began in June of 2016 and monitoring year one efforts are scheduled for the end of October 2016. More detailed information related to the project activity, history, and contacts can be found in Appendix A Tables 1 and 2.

Monitoring will consist of collecting morphological, vegetative, and hydrological data to assess the project success based on the restoration goals and objectives on an annual basis for seven years or until the success criteria is met. The success of the project will be assessed using measurements of the stream channel's dimension, substrate composition permanent photographs, vegetation, surface water hydrology, and visual assessments. Monitoring requirements include:

Monitoring Requirements													
Parameter	Monitoring Feature	Quantity Length By Reach (ft)											
		Moores R1	Pond Trib.	Moores R2	Moores R3	Silage R1	Silage R2	UT1	Cow 1	Cow 2	Barn 1	Barn 2	Frequency

## **1.5 Project Performance**

The Moores Fork as-built data showed some deviation from the design values, particularly for cross-sectional area and bankfull width in Reach 3 where the majority of the repair work was conducted in early 2016. Observations of the repair areas over the past three months indicate the site is on a trajectory toward increased stability and improved function as compared to pre-repair conditions. One cross-section (XSM7) that was originally intended to serve as a riffle is actually more representative of a run feature and will be treated as such going forward. Data from this cross-section have been omitted from the riffle parameters reported herein. Pebble count data from Moores Fork indicate a modest coarsening of the substrate, which is consistent with observations of bed materials following the major flood event in April 2015.

As-built data from both reaches of the Silage Tributary also show some deviations from the design values. On a small channel such as this, slight differences in bankfull dimensions translate to what appear to be significant differences in parameters such as bankfull cross-sectional area and width-to-depth ratio. These being enhancement reaches where targeted (as opposed to reach-wide) bank sloping, benching and in-stream structures were used, matching the precise design values was less critical than, for example, on a new off-line restoration reach. In Reach 1, the fascines on the upper slopes are robust on the left side and less robust on the right side. We believe that the primary cause of this was drought conditions which began after the left bank fascines were installed, just as right bank installations were beginning. Another contributing factor may be stormwater runoff originating from a pasture on the right terrace. There do not appear to be significant stability issues at this time, however.

The MY0 vegetation plot data indicate that the project is on track to meet the interim criterion for survival and growth of 320 stems per acre at the end of the year three monitoring period. Ten of the 12 vegetation plots have stem densities of 320 or more stems per acre and the mean stem density for planted stems is 497 stems per acre. Vegetation plots 2 and 3, each with a density of 280 stems per acre, did not meet the interim success criteria. The site includes a diverse assemblage of nine species of native trees. Herbicide treatments of exotic invasive plants were conducted during the initial construction phase, with a focus on the buffers along the Barn, Corn and Silage Tributaries. Recent observations indicate that the extent of invasive plants has been greatly reduced but that buffer areas, including those along Moores Fork, will need to be treated for exotic invasive plants again in the future.

Summary data related to performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information can be found in the mitigation plan document. All raw data presented in the appendices are available upon request.

## 2.0 METHODOLOGY

The stream monitoring methodologies utilized in 2015 are based on standard guidance and procedures documents (Rosgen 1996 and USACE 2003).

- Cross-section data were collected throughout four reaches using a total station survey. Sixteen cross-sections were surveyed. Cross-sections were permanently marked with capped rebar and PVC conduit.
- Sixty-seven permanent photo points were established throughout the project to visually monitor stream stability and vegetation.
- Wolman pebble counts were conducted at ten representative riffle cross-sections to evaluate particle size distribution over time. A minimum of 100 particles were selected at random and measured (Harrelson 1994).
- Vegetation monitoring included documenting species composition and survival of planted stems within twelve randomly located vegetation plots. Each 0.025 acre vegetation plot was permanently marked with rebar and PVC conduit at all four corners.
- Two crest gauges were installed and will be checked during semi-annual visits to determine if a bankfull event has occurred. The crest gauges were installed and surveyed at riffles on Moores Fork and Silage Tributary.
- Visual assessments will be performed on all stream and buffer restoration areas on a semi-annual basis. Problem areas will be noted, including channel instability (lateral and/or vertical instability, structure failure/instability and/or piping,

headcuts), vegetation health (low stem density, vegetation mortality, invasive species or encroachment), beaver activity, and livestock access. Areas of concern will be mapped, photographed, and described in future monitoring reports.

## **As-Built Plan Sheet**

I, DAVID S. TURNER, AS A DULY REGISTERED PROFESSIONAL LAND SURVEYOR IN THE STATE OF NORTH CAROLINA, HEREBY CERTIFY THAT THE DATA SHOWN ON THIS DRAWING, WAS OBTAINED UNDER MY SUPERVISION. IS AN ACCURATE AND COMPLETE REPRESENTATION OF WHAT WAS CONSTRUCTED IN THE FIELD, AND THAT THE PHYSICAL DIMENSIONS OR **ELEVATIONS SHOWN THUS ARE AS-BUILT CONDITIONS EXCEPT WHERE** OTHERWISE NOTED HEREON. WITNESS MY ORIGINAL SIGNATURE, REGISTRATION NUMBER, AND SEAL THIS 6th DAY OF NOVEMBER, 2014.

une L-455' DAVID S. TURNER, /P.L.S. #L-4551

## SHEET INDEX

SHEET 1 - TITLE, VICINITY MAP, & SHEET INDEX

AND CONTROL POINTS
SHEET 3 - MOORES FORK STA. 21+00 TO 32+00
SHEET 4 - MOORES FORK STA. 32+00 TO 43+00
SHEET 5 - MOORES FORK STA. 43+00 TO 54+00
SHEET 6 - MOORES FORK STA. 54+00 TO 65+25
SHEET 7 - POND TRIB & BARN TRIB STA. 10+00 TO 14+00
SHEET 8 - BART TRIB STA. 14+00 TO 47+30
SHEET 9 - CORN TRIB STA. 11+00 TO 24+60
SHEET 10 - SILAGE TRIB STA. 10+00 TO 19+50
SHEET 11 - SILAGE TRIB STA. 19+50 TO 30+50
SHEET 12 - SILAGE TRIB STA. 30+50 TO 37+50
SHEET 13 - COW TRIBS 1 & 2 AND UT1

**GENERAL NOTES:** 

1. ALL DISTANCES ARE HORIZONTAL UNLESS OTHERWISE NOTED.

2. THE VERTICAL DATUM IS NAVD88 (GEOID12). 3. THE BASIS OF BEARINGS IS NCGS STATE PLANE GRID COORDINATES NAD83 (NSRS 2011) DATUM.

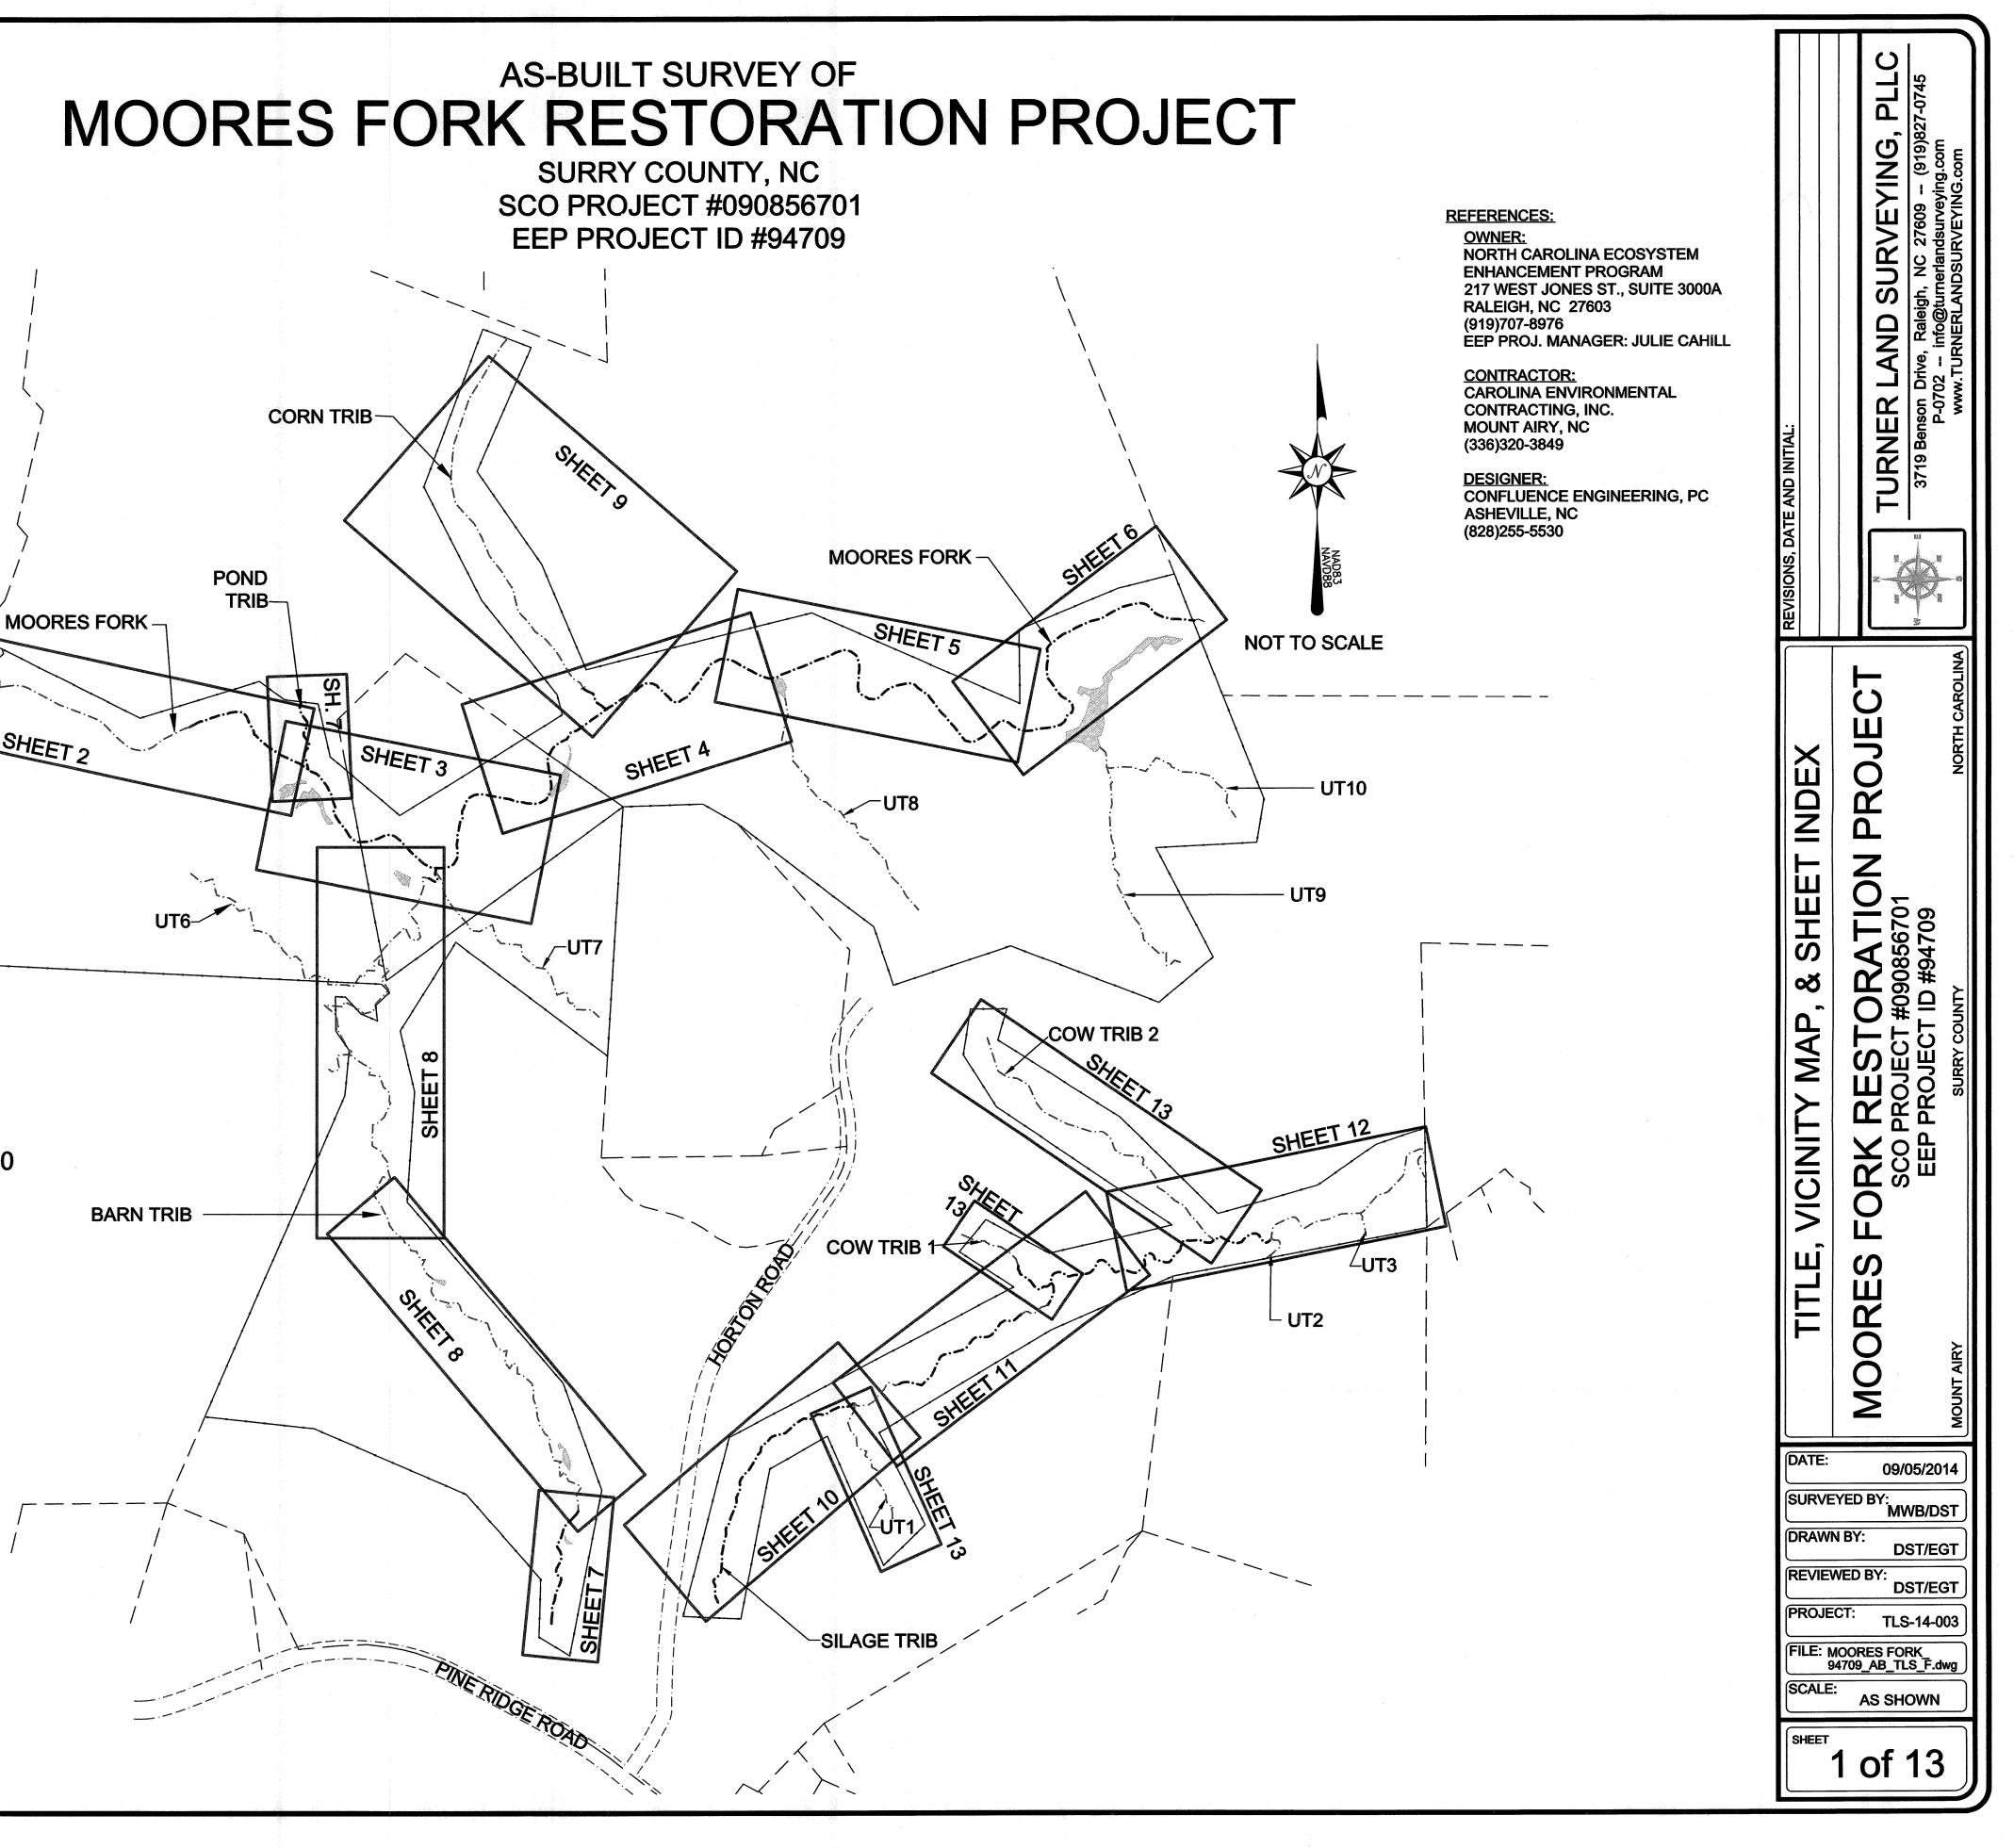

4. CONTROL ESTABLISHED USING VRS RTK GPS AND CONFIRMED DURING AS-BUILT SURVEY. AS-BUILT CONTROL POINTS ARE LISTED ON SHEET 2.

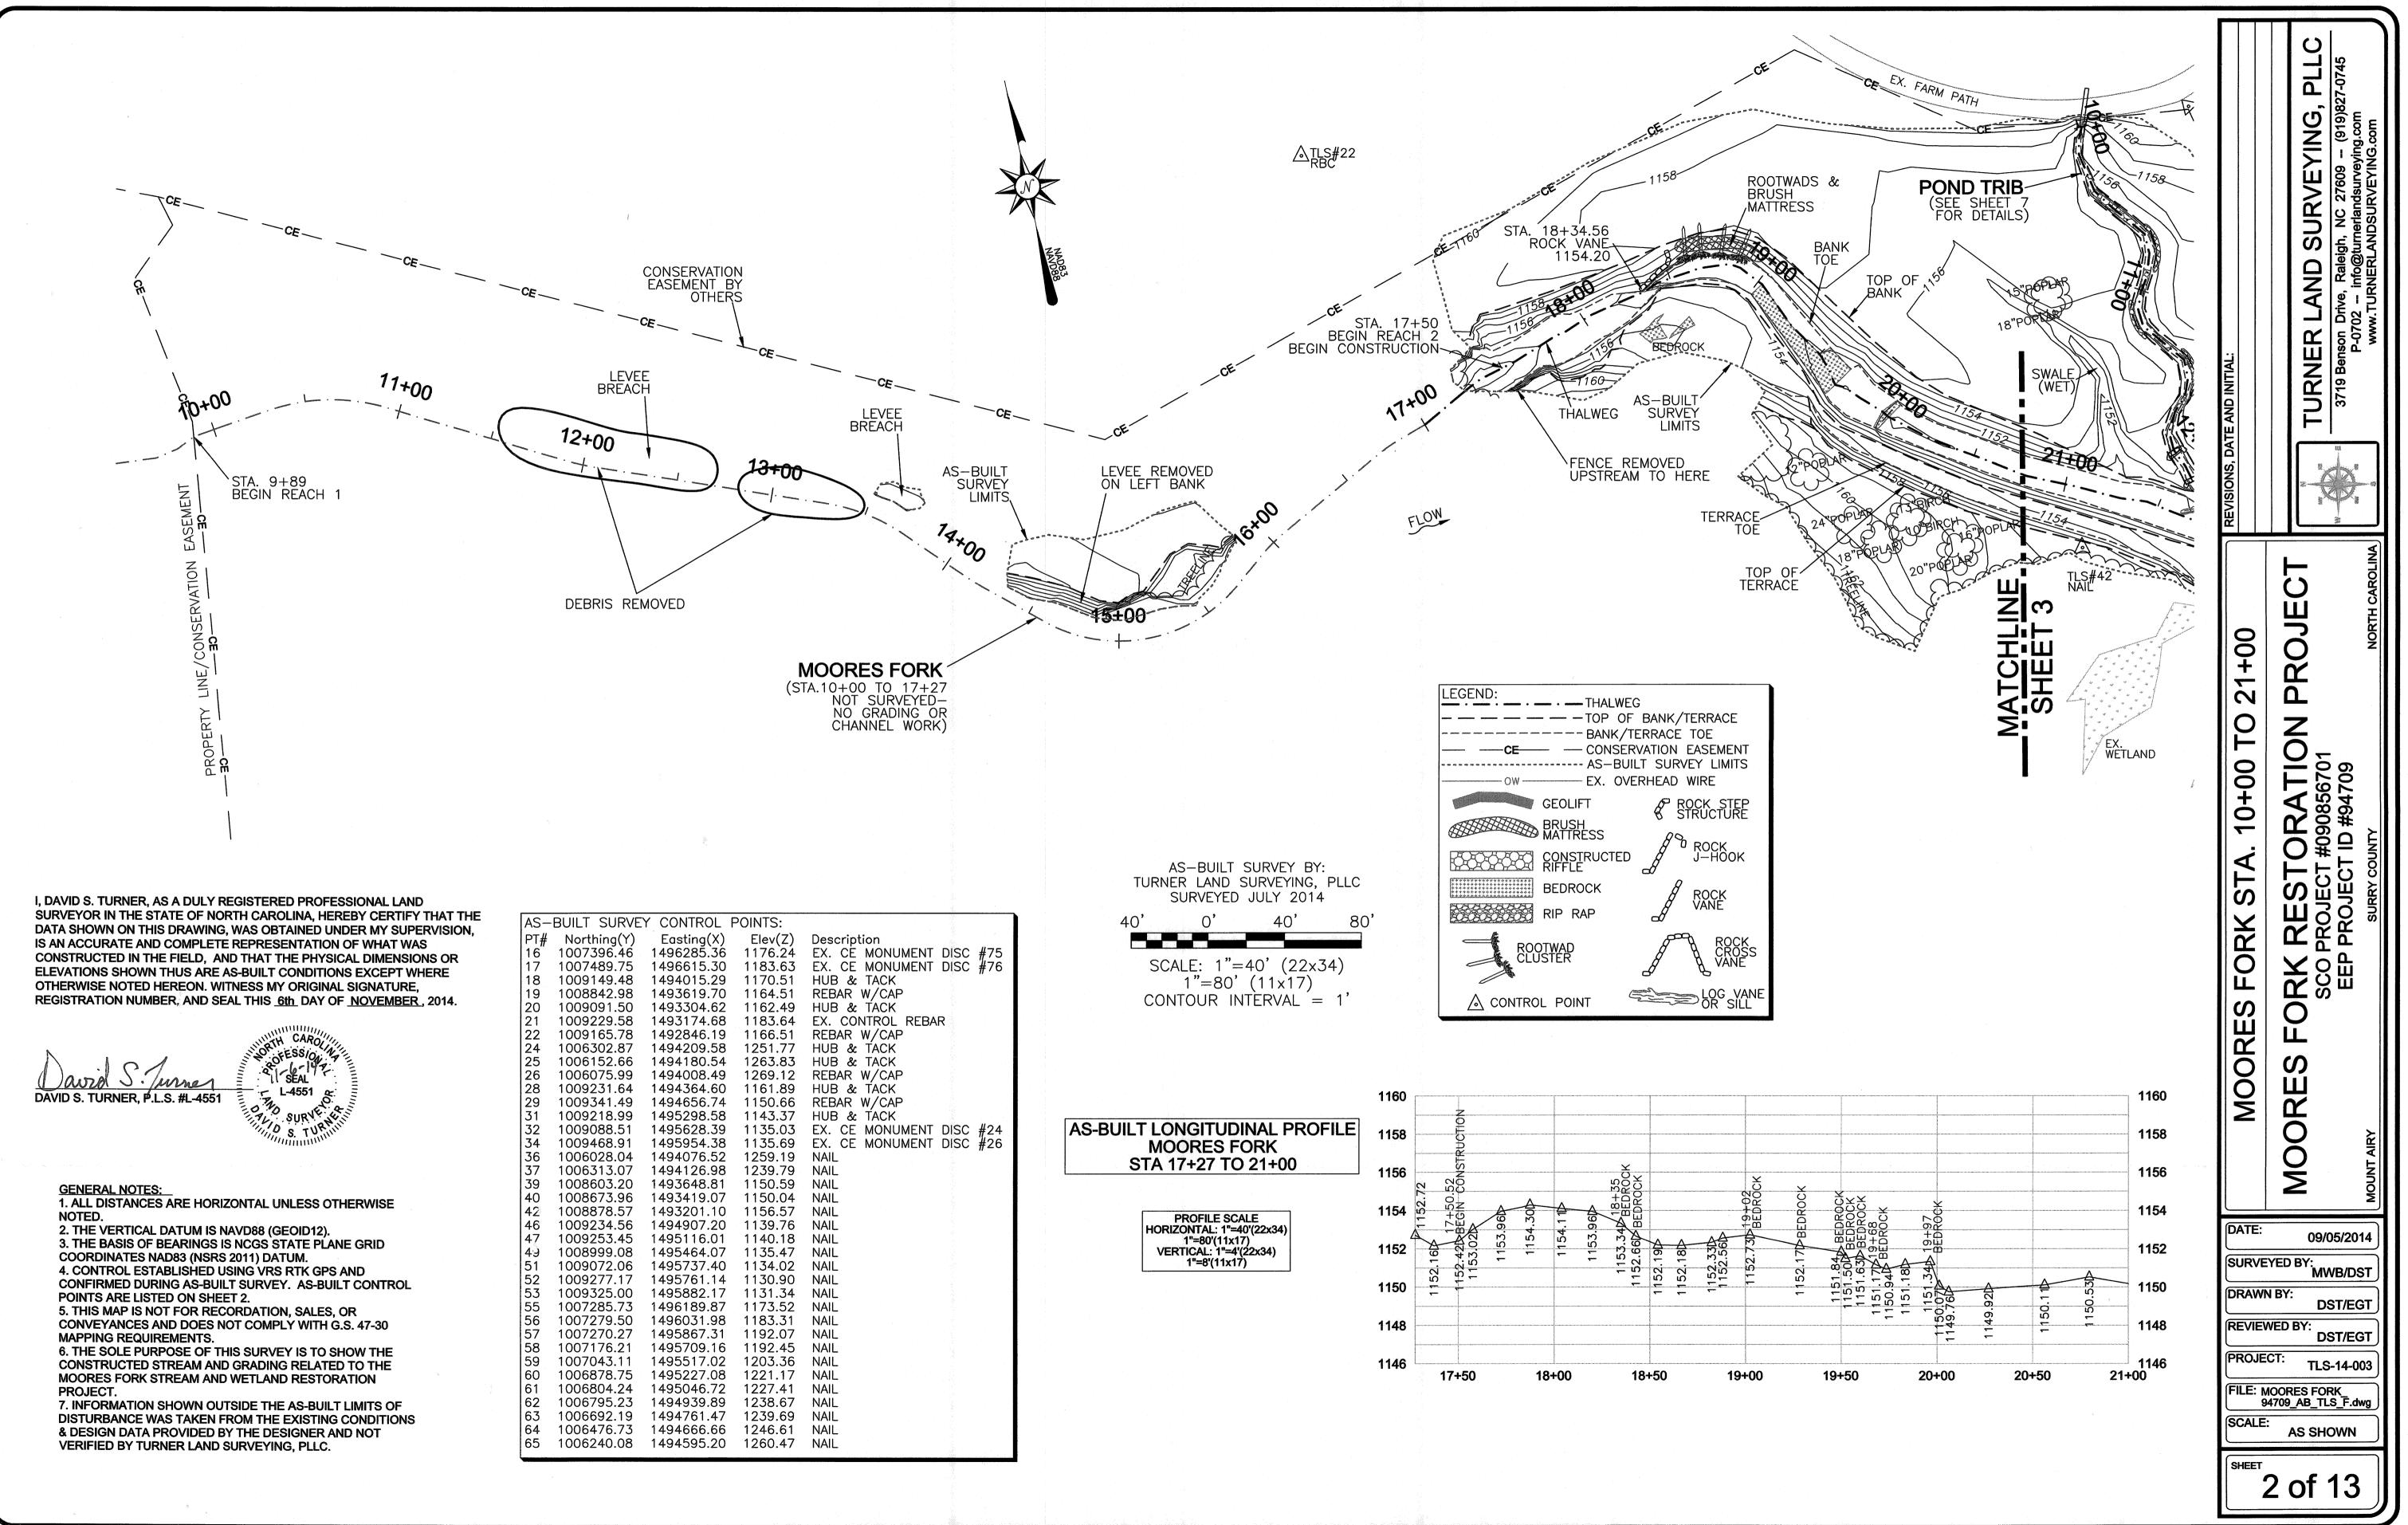

5. THIS MAP IS NOT FOR RECORDATION, SALES, OR CONVEYANCES AND DOES NOT COMPLY WITH G.S. 47-30 MAPPING REQUIREMENTS.

6. THE SOLE PURPOSE OF THIS SURVEY IS TO SHOW THE CONSTRUCTED STREAM AND GRADING RELATED TO THE MOORES FORK STREAM AND WETLAND RESTORATION PROJECT.

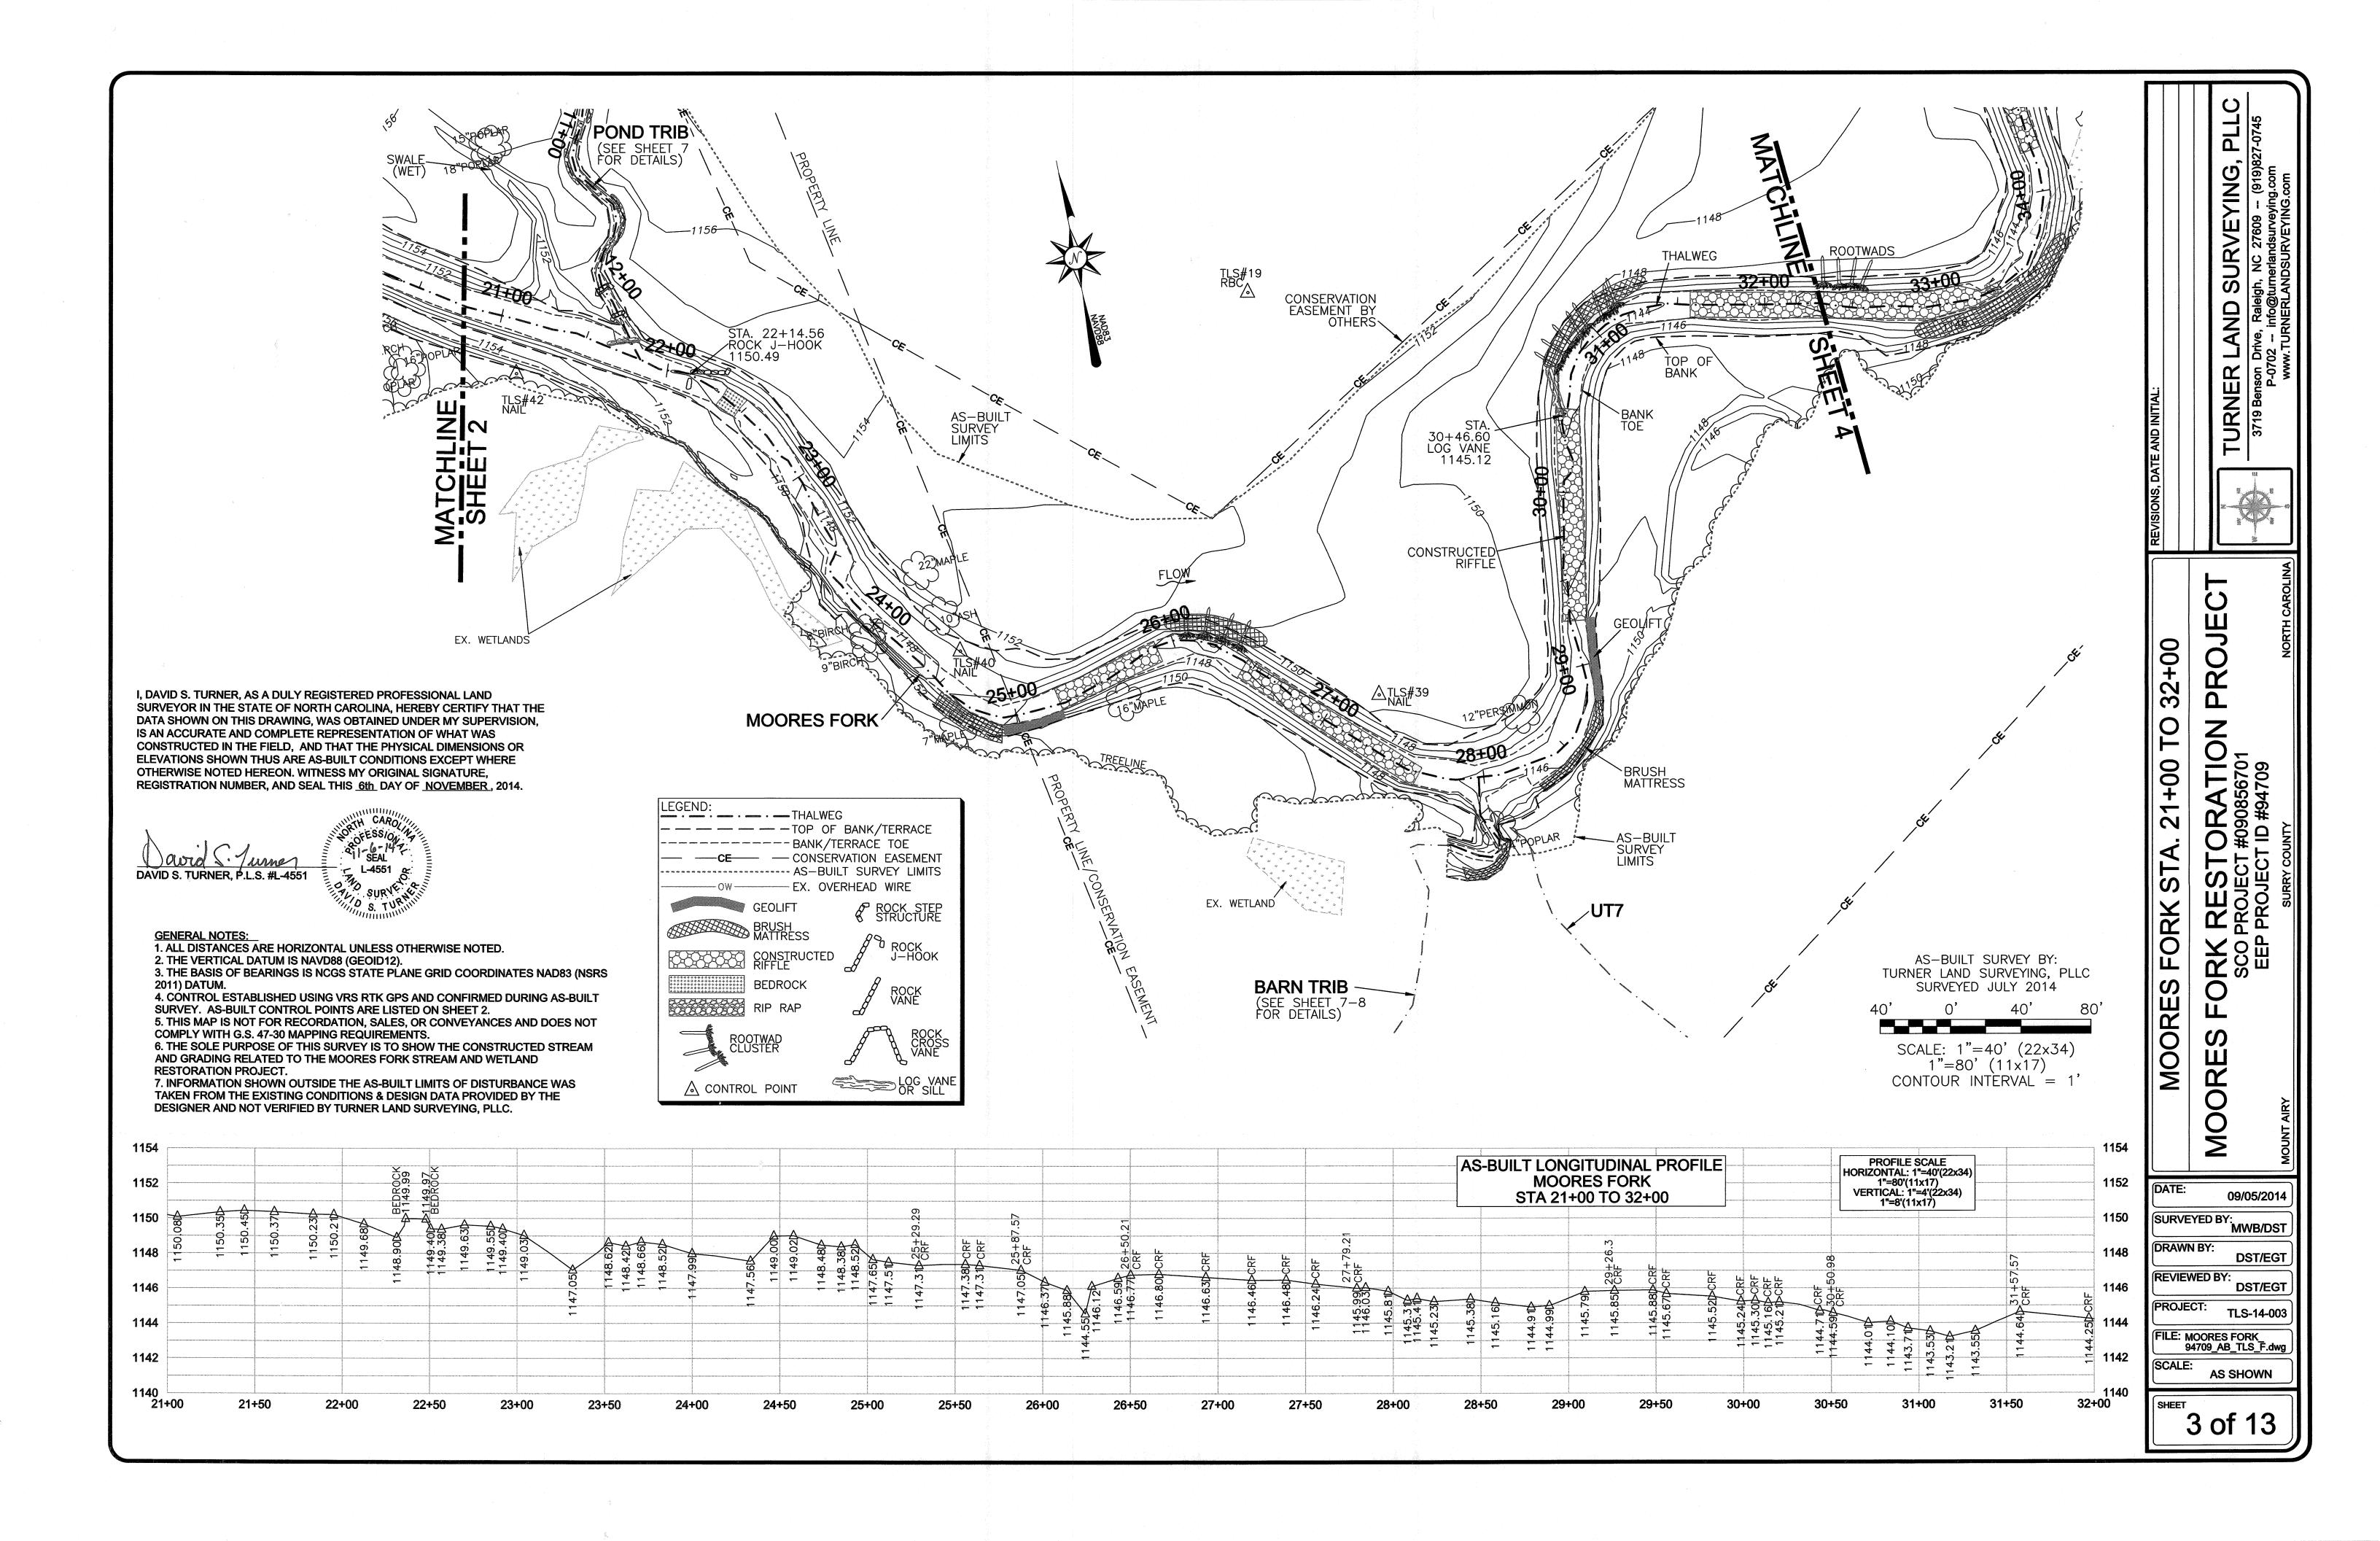

7. INFORMATION SHOWN OUTSIDE THE AS-BUILT LIMITS OF DISTURBANCE WAS TAKEN FROM THE EXISTING CONDITIONS & DESIGN DATA PROVIDED BY THE DESIGNER AND NOT VERIFIED BY TURNER LAND SURVEYING, PLLC.
