RE: Neighbors Branch/Walton Crawley Branch Monitoring (DMS Project # 92872, Contract # D09023S) Final Year 5 (2020) Annual Monitoring Report

12-004.21

Dear Matthew:

Axiom Environmental, Inc. (AXE) is pleased to provide you with one hard copy and one cd of electronic files for the Final Neighbors Branch/Walton Crawley Branch Year 5 (2020) Annual Monitoring Report. We received your comments via email on January 15, 2021 and have addressed them as follows.

• Table 1: Please update the Length and Area Summations section of the table to reflect the official assets associated with the project. Neighbors Branch/Walton Crawley will be presented for closeout in 2021, and the official credits on the site are 3,953.667 SMUs and 1.588 WMUs.

Table 1 was updated to reflect the official project assets.

- Table 2: Please add the following activities and dates to table:
 - In order to capture the amount of invasive work conducted on the site, please update the August 2019 entry to: Aug/Sep/Nov/Dec 2019.
 - o Please add another Invasive Treatment entry for 2020: Apr/Jun 2020

The 2019 invasive species treatment entry was edited to show Aug/Sep/Nov/Dec 2019, and a 2020 invasive species treatment entry was added to the table.

- Figure E1: The legend has * symbols next to the years. Are there notes associated with the * that should be included with the table? Please update or remove as necessary.
 - The * symbols correspond with data citations that didn't print for the draft submittal. The citations have been readded to the figure.
- CCPV: Thank you for providing updated invasive polygons on the CCPV. DMS will direct the invasive contractor to these areas before the project closes out.
 - No problem, keep us posted regarding pre-closeout invasive treatments.

Digital Files Review

• It appears that there are 2 encroachment features in the digital submission, but only one is displayed on Fig 2B. Please include this encroachment on the CCPV and discuss briefly in report, or remove the encroachment feature from the digital submission if it is not relevant.

The irrelevant encroachment area was removed from the shapefile.

Axiom Environmental, Inc.

NC Division of Mitigation Services Neighbors Branch/Walton Crawley Branch Monitoring Page 2 of 2

Please let us know if you have any questions or comments regarding any component of this submittal. Thank you for the opportunity to continue to assist the Division of Mitigation Services with this important project.

Sincerely,

AXIOM ENVIRONMENTAL, INC.

Kenan R. Jernigan *Project Scientist*

1.0 PROJECT SUMMARY

The North Carolina Division of Mitigation Services (NCDMS) has established the Neighbors Branch/Walton Crawley Branch Stream and Wetland Restoration Site (Site). The primary goals of the project focused on improving water quality and long term stability by reducing nutrient loading from the on-site cattle and horse operation, reducing excess sedimentation input from Site channel banks and contributing non-jurisdictional tributaries/drainages, reducing excess sedimentation from Site access roads and deteriorated crossings, increasing the attenuation of floodwater flows, reintroducing natural watershed flows to Walton Crawley Branch by removing a pond and restoring the channel through its natural valley, and restoring and enhancing aquatic and riparian habitat. Long term stability will be evidenced by channels maintaining stable inverts and banks over an extended period of time.

These goals were accomplished through the following objectives.

- Reduce point (i.e. cattle/horses directly accessing the channel) and non-point source (i.e. stormwater runoff through pastures) pollution associated with an on-site cattle and horse operation by installing exclusionary fencing along the stream and riparian buffer, and by providing a vegetative buffer on stream banks and adjacent floodplains to treat nutrient enriched surface runoff from adjacent pastureland.
- Stabilize degraded portions of on-site streams, eroding ephemeral/stormwater channels, and existing maintained dirt roads to reduce sediment inputs. Stabilization methods included:
 - Restoring a stable dimension, pattern, and profile to selected sections of channels to ensure the channel will transport and attenuate watershed flows and sediment loads without aggrading or degrading.
 - Stabilize selected channel banks by excavating bankfull benches, placing stream structures to reduce shearing forces on outside meander bends, and planting native vegetative species to provide soil stability.
 - O Stabilize ephemeral/stormwater channels by planting native vegetation along eroded banks and floodplain and constructing stabilization weirs through the channel valley to lower facet slopes and decrease erosion.
 - o Place gravel along existing degraded soil roads that are situated adjacent to Site streams.
- Reintroduce natural watershed flows to Walton Crawley Branch by restoring the channel through the low point of the natural valley and removing a dam that impedes natural down valley flows.
- Improve aquatic habitat by enhancing stream bed variability, providing shading/covered areas within the stream channel, and introducing woody debris in the form of rootwads, log vanes, and log sills.
- Enhance fish passage within Neighbors Branch and Walton Crawley Creek. This was accomplished by eliminating a pond and restoring the stream through the natural valley and by restoring Neighbors Branch and replacing an existing perched culvert to allow fish passage upstream.
- Enhance riparian wildlife habitat by:
 - Fencing cattle out of existing wetlands and planting impacted wetlands with native vegetative species. Wetlands were also restored by raising Site stream inverts to allow groundwater tables to rise throughout the affected valleys.
 - o Fencing livestock out of existing and restored riparian buffers as well as installing alternative watering devices that will ensure livestock have sufficient watering areas. This is detailed further in the Farm Management Plans completed for the Site by NCDMS.
 - Vegetating the existing fescue dominated riparian buffers with native trees, shrubs, herbs, and grasses. Forest vegetation species were selected by studying a Reference Forest Ecosystem located on-site and reviewing Montane Alluvial Forest species listed in

Classification of the Natural Communities of North Carolina: Third Approximation (Schafale and Weakley 1990).

• Creating wildlife corridors through agricultural lands which have significantly dissected the landscape. The corridors will provide connectivity to a diversity of habitats including mature forest, early successional forest, stream-side forest, riparian wetlands, and uplands.

The Site is located approximately six miles southeast of the town of Marion (Figure 1, Appendix B). The Site is situated due southwest of the intersection of Deer Park Road and Harmony Grove Road in McDowell County, North Carolina and is located within the United States Geological Survey (USGS) Hydrologic Unit and Targeted Local Watershed 03050101040010 (North Carolina Division of Water Quality Subbasin 03-08-30) of the Catawba River Basin and will service USGS 8-digit Cataloging Unit 03050101.

The contributing watersheds are characterized primarily by forest land (approximately 84 percent of the total area) with pasture at the lower elevations (approximately 10 percent of the total area) and low-density residential development scattered along the outer fringes of the watershed. Impervious surfaces appear to account for approximately one percent of the watershed land surface. Prior to Site construction, riparian vegetation had been removed, stream channels were manipulated, and hoof shear from livestock on stream banks and floodplain soils was responsible for degraded water quality and unstable channel characteristics (stream entrenchment, erosion, and bank collapse).

Project mitigation efforts resulted in the following:

- Restore 2456 linear feet of Site streams
- Enhance (Level I) 202 linear feet of Site streams
- Enhance (Level II) 1863 linear feet of Site streams
- Preserve 3139 linear feet of Site streams
- Restore 0.52 acre of existing hydric soils to riparian wetlands
- Enhance 1.62 acres of riparian wetlands
- Preserve 1.29 acres of riparian wetlands

The Muddy Creek Restoration Partnership (Partnership) was formed in 1998 to address impacts to the Muddy Creek Watershed. The Partnership completed the *Muddy Creek Watershed Restoration Initiative Feasibility Report and Restoration Plan* (Watershed Plan) for the Muddy Creek Watershed in December of 2003 (MCRP 2003). Since 2004 NCDMS has informally participated in the Partnership by implementing priority projects named by the partnership and adopted the 2003 report as part of its Local Watershed Plan (LWP). The NCDMS's *Upper Catawba River Basin Restoration Priorities* (2009) identifies North Muddy Creek as a Targeted Local Watershed (TLW). The Site is located within the North Muddy Creek Watershed. In 2008 NCDMS contracted with a consulting firm to conduct outreach programs with landowners and identify additional project sites in the Muddy Creek Watershed.

The primary goals identified by the Partnership's Watershed Plan include the following.

- 1. Restore the Watershed to its Full Intended Use
- 2. Restore Riparian Buffers
- 3. Enhance Open Space Preservation
- 4. Improve Water Quality
- 5. Restore Physical Habitat
- 6. Establish a Trout Fishery

The Watershed Plan listed the following components of watershed restoration to be expected:

- 1. Natural Channel Design Stream Restoration
- 2. Riparian Reforestation
- 3. Livestock Exclusion
- 4. Riparian Forest Preservation

These four components were included within the *Neighbors Branch/Walton Crawley Branch Site Mitigation Plan* (NCDMS 2013). The project restored the watershed to its full intended use by restoring a stream, floodplain, and riparian wetland ecosystem through stream and wetland restoration, enhancement, and preservation. The project restored riparian buffers through revegetation of buffer zones with native riparian and wetland species along all Site streams. The project enhanced open space preservation by placing Site streams, wetlands, and their buffers into a permanent conservation easement. The overall Site helps improve water quality by reducing sedimentation in on-Site streams and planted a vegetated riparian buffer that filters nutrients from adjacent pasturelands. Additionally, exclusionary fencing and alternate watering devices removed livestock from accessing on-site channels and riparian buffers. The project restored and enhanced physical habitat for both aquatic and terrestrial species by planting native vegetation along stream banks and riparian buffers, creating wildlife corridors through a dissected landscape, and restoring bedform variability to Site streams. The stabilization of streams and buffers in the project area enhanced water quality in downstream receiving waters, which should help in the re-establishment of the watershed's ability to host trout and enhance their ability to propagate.

Site design was completed on March 7, 2013. Site construction and planting were completed in December 2015. Completed project activities, reporting history, completion dates, project contacts, and project attributes are summarized in Tables 1-4 (Appendix A).

<u>Stream Success Criteria</u>: Success criteria for stream restoration will include 1) successful classification of the reach as a functioning stream system (Rosgen 1996) and 2) channel variables indicative of a stable stream system.

Collected data will be utilized to determine the success in restoring stream channel stability. Specifically, the width-to-depth ratio and bank-height ratios should be indicative of a stable or moderately unstable channel with minimal changes in cross-sectional area, channel width, and/or bank erosion along the monitoring reach. In addition, channel abandonment and/or shoot cutoffs must not occur and sinuosity values must remain relatively constant. Visual assessment of instream structures will be conducted to determine if failure has occurred. Failure of a structure may be indicated by collapse of the structure, undermining of the structure, abandonment of the channel around the structure, and/or stream flow beneath the structure.

Stream Dimension: General maintenance of a stable cross-section and hydrologic access to the floodplain features over the course of the monitoring period will generally represent success in dimensional stability. Some changes in dimension (such as lowering of bankfull width) should be expected. Riffle cross-sections should generally maintain a bank-height ratio approaching 1.0, with some variation in this ratio naturally occurring. Pool cross-sections naturally adjust based on recent flows and time between flows, therefore more leeway on pool cross-section geometry is expected.

<u>Stream Pattern and Profile</u>: The profile should not demonstrate significant trends towards degradation or aggradation over a significant portion of a reach. Additionally, bed form variables should remain noticeably intact and consistent with original design parameters that were based off

of reference conditions. Pattern features should show little adjustment over the standard 5-year monitoring period and will be monitored to ensure adjustment is minor prior to close out.

<u>Substrate</u>: Substrate measurements should indicate the progression towards or the maintenance of the known distributions from the design phase.

<u>Sediment Transport</u>: There should be an absence of any significant trend in the aggradational or depositional potential of the channel.

<u>Hydraulics</u>: A minimum of two bankfull events must be documented within the standard 5-year monitoring period. The two bankfull events shall occur within separate years.

<u>Vegetation Success Criteria</u>: Success criteria have been established to verify that the vegetation component supports community elements necessary for forest development. Success criteria are dependent upon the density and growth of characteristic forest species. An average density of 320 stems per acre of planted stems must be surviving in the first three monitoring years. Subsequently, 290 planted stems per acre must be surviving in year 4, and 260 planted stems per acre in year 5.

Wetland Hydrology Success Criteria: Target hydrological characteristics include saturation or inundation for 5 to 12.5 percent of the growing season, during average climatic conditions. During growing seasons with atypical climatic conditions, groundwater gauges in reference wetlands may dictate threshold hydrology success criteria (75 percent of reference). These areas are expected to support hydrophytic vegetation. If wetland parameters are marginal as indicated by vegetation and/or hydrology monitoring, a jurisdictional determination will be performed.

2.0 METHODS

Monitoring of restoration efforts will be performed for five years, or until success criteria are fulfilled. Monitoring is proposed for the stream channel, vegetation, and wetland hydrology. In general, the restoration success criteria, and required remediation actions, are based on the *Stream Mitigation Guidelines* (USACE et al. 2003). Monitoring features are described below and are depicted on Figures 2A-B (Appendix B).

Streams

The restored stream reaches are proposed to be monitored for geometric activity as follows.

- 1750 linear feet of stream profile
- 5 riffle cross-sections
- 3 pool cross-section

The data will be presented in graphic and tabular format. Data to be presented will include 1) cross-sectional area, 2) bankfull width, 3) average depth, 4) maximum depth, 5) width-to-depth ratio, 6) meander wavelength, 7) belt-width, 8) water surface slope, and 9) sinuosity. Substrate analysis will be evaluated through pebble counts at five cross sections and data presented as a D50 for stream classification and tracking purposes. The stream will subsequently be classified according to stream geometry and substrate (Rosgen 1996). Significant changes in channel morphology will be tracked and reported by comparing data in each successive monitoring year. Annual photographs will include 43 fixed station photographs (Appendix B). In addition, the Site contains two stream crest gauges to assist with documentation of

bankfull events. Two bankfull events were documented during monitoring year 5 (2020) making a total of at least eight bankfull events occurring in five separate monitoring years (Table 12, Appendix E).

Early in year 1 (2016), several structures were damaged by significant storm events that occurred shortly after Site construction. Warranty repair work was completed in October 2016 to address these issues. The repaired structures remained stable during year 5 (2020). One stream area of concern remained during year 5 (2020) monitoring. The header of a drop structure at the bottom of a series of structures on UT-1 to Neighbors Branch (approximately 11+15) has failed, causing serious degradation in the accompanying pool and downstream riffle (Area of Concern #1, Figure 2A, Appendix B). The down-cutting is a threat to the integrity of the rock structure above the pool. Overall site streams were exhibiting stability and no areas of additional instability were observed.

In March 2019, DMS developed implemented an adaptive management plan and repaired several areas of concern that were identified in the MY3 report. The work included removing debris that was dumped in the easement near the downstream end of Walton Crawley Branch and around two culverted crossings outside the easement. A log J-hook structure at approximately sta: 21+35 on Walton Crawley Branch was repaired by hand. The material behind the vane arm had scoured out during a high flow event and this material was replaced by hand. The final repair consisted of stabilizing a log J-hook structure near sta: 26+65 on Walton Crawley Branch and repairing approximately 20 feet of adjacent stream bank erosion. The eroding banks were upstream of the structure and were damaged during a high flow event. If these banks were not repaired, the log J-hook would have likely failed in the future. The banks were regraded, matted and live staked. During the stream bank repairs, the log J-hook structure was stabilized by adding additional rock and ensuring the footer and header logs were intact. The repairs that occurred in March 2019 have been successful and remain stable through year 5 (2020).

Vegetation

Restoration monitoring procedures for vegetation will monitor plant survival and species diversity. Planted areas within the Site include approximately 12.3 acres. After planting of the area was completed, eight vegetation plots were installed and monitored at the Site; annual monitoring results can be found in Appendix C. Annual measurements of vegetation will consist of 8 CVS vegetation plots.

A photographic record of plant growth should be included in each annual monitoring report; current monitoring photographs are included in Appendix B. During the first year, vegetation will receive a cursory, visual evaluation on a periodic basis to ascertain the degree of overtopping of planted elements by nuisance species. Subsequently, quantitative sampling of vegetation will be performed as outlined in the CVS-EEP Protocol for Recording Vegetation, Version 4.2 (Lee et al. 2008) in September of the first monitoring year and annually between June 1 and September 30 for the remainder of the monitoring period until vegetation success criteria are achieved.

Year 5 stem count measurements indicate planted stem densities are well-above the required 260 stems per acre. Planted stem density across the Site is 435 planted stems per acre (excluding livestakes) (Table 9, Appendix C). In addition, all eight individual CVS plots met success criteria based on planted stems alone. Therefore, the Site is currently meeting vegetation success criteria.

Several dense populations of Chinese privet (*Ligustrum sinense*) and multiflora rose (*Rosa multiflora*) were observed along Neighbors Branch, Walton Crawley Branch, and UT-2 to Walton-Crawley Branch (Figures 2A-B, Appendix B). NCDMS currently has implemented an invasive management plan and is under contract through closeout. During the last site visit invasive treatment areas were closely inspected. Treatments throughout the site have been extremely successful, and populations of invasive species have

been reduced significantly.

Several areas of compromised easement integrity were observed during year 5 (2020). The fence on the northeast side of the crossing over UT-2 to Neighbors Brach has been compromised by large amounts of sediment during several high flow events. DMS has been working with the landowner to repair the downed fence, and some repairs have been made; however, the overall integrity of the fence remains compromised. Additionally, the footpath and foot-bridge identified in MY3 that extends through the conservation easement just north of UT-1 remains. DMS and DEQ Stewardship worked with the landowner to limit the width of the path to a minimum cutting for foot traffic only. Based on visual observations and photodocumentation, the foot path has remained the same width with no additional vegetation disturbed. These areas are depicted on Figures 2A-B (Appendix B).

Wetland Hydrology

Two groundwater monitoring gauges were installed to take measurements after hydrological modifications were performed at the Site. Hydrological sampling will occur during the growing season (March 26 to November 5). Approximate locations of gauges are depicted on Figure 2A (Appendix B) and hydrology data can be found in Appendix E.

Both gauges were saturated or inundated for the entire 2020 growing season. Wetland hydrology is currently meeting success criteria.

2. Low Stem Density Areas	None	0.1 acres	none	0	0.00	0.0%
2B. Low Planted Stem Density Areas	None	0.1 acres	none	0	0.00	0.0%
			Total	0	0.00	0.0%
3. Areas of Poor Growth Rates or Vigor	None	0.25 acres	N/A	0	0.00	0.0%
Cumulative Tota						0.0%

Easement Acreage²

33.4

Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Easement Acreage
4. Invasive Areas of Concern ⁴	Isolated populations of Chinese privet, and multiflora rose	1000 SF	blue and orange polygons	11	0.18	0.5%
5. Easement Encroachment Areas ³	Mowed footpath and footbridge contructed within easement.	none	yellow	1	0.07	0.2%

- 1 = Enter the planted acreage within the easement. This number is calculated as the easement acreage minus any existing mature tree stands that were not subject to supplemental planting of the understory, the channel acreage crossings or any other elements not directly planted as part of the project effort.
- 2 = The acreage within the easement boundaries.
- 3 = Encroachment may occur within or outside of planted areas and will therefore be calculated against the overall easement acreage. In the event a polygon is cataloged into items 1, 2 or 3 in the table and is the result of encroachment, the associated acreage should be tallied in the relevant item (i.e., item 1,2 or 3) as well as a parallel tally in item 5.
- 4 = Invasives may occur in or out of planted areas, but still within the easement and will therefore be calculated against the overall easement acreage. Invasives of concern/interest are listed below. The list of high concern spcies are those with the potential to directly outcompete native, young, woody stems in the short-term (e.g. monitoring period or shortly thereafter) or affect the community structure for existing, more established tree/shrub stands over timeframes that are slightly longer (e.g. 1-2 decades). The low/moderate concern group are those species that generally do not have this capacity over the timeframes discussed and therefore are not expected to be mapped with regularity, but can be mapped, if in the judgement of the observer their coverage, density or distribution is suppressing the viability, density, or growth of planted woody stems. Decisions as to whether remediation will be needed are based on the integration of risk factors by DMS such as species present, their coverage, distribution relative to native biomass, and the practicality of treatment. For example, even modest amounts of Kudzu or Japanese Knotweed early in the projects history will warrant control, but potentially large coverages of Microstegium in the herb layer will not likley trigger control because of the limited capacities to impact tree/shrub layers within the timeframes discussed and the projects of treating extensive amounts of ground cover. Those species with the "watch list" designator in gray shade are of interest as well, but have yet to be observed across the state with any frequency. Those in *red italics* are of particular interest given their extreme risk/threat level for mapping as points where isolated specimens are found, particularly ealry in a projects monitoring history. However, areas of discreet, dense patches will of course be mapped as polygons. The symbology scheme below was one that was found to be helpful for symbolzing invasives polygons, particularly for situations where the condition for an a

DESCRIPTION OF WORK	SHEETS IN THIS DOCUMENT
	Description of database file, the report worksheets, and a summary of project(s)
Metadata	and project data.
	Each project is listed with its PLANTED stems per acre, for each year. This
Proj, planted	excludes live stakes.
	Each project is listed with its TOTAL stems per acre, for each year. This includes
Proj, total stems	live stakes, all planted stems, and all natural/volunteer stems.
	List of plots surveyed with location and summary data (live stems, dead stems,
Plots	missing, etc.).
Vigor	Frequency distribution of vigor classes for stems for all plots.
Vigor by Spp	Frequency distribution of vigor classes listed by species.
	List of most frequent damage classes with number of occurrences and percent of
Damage	total stems impacted by each.
Damage by Spp	Damage values tallied by type for each species.
Damage by Plot	Damage values tallied by type for each plot.
Planted Stems by Plot and	A matrix of the count of PLANTED living stems of each species for each plot;
Spp	dead and missing stems are excluded.
ALL Stems by Plot and	A matrix of the count of total living stems of each species (planted and natural
spp	volunteers combined) for each plot; dead and missing stems are excluded.

Neighbors Branch/Walton Crawley Branch Site (DMS Project Number 92872)

Date of Data Collection	Date of Occurrence	Method	Photo (if available)
August 19, 2016	July 4, 2016	Crest gauge data indicates a bankfull event after approximately 1.88 inches of rain documented* in one day.	
May 18, 2017	April 23, 2017	Crest gauge data indicates a bankfull event after approximately 1.76 inches of rain documented* in one day.	
May 9, 2018	April 24, 2018	Crest gauge data along with wrack observed on the floodplains of both Neighbors Branch and Walton Crawley Branch indicate a bankfull event after 3.89 inches of rain documented** over two days.	1-2
September 25, 2018	September 16, 2018	Crest gauge data indicates a bankfull event after 2.42 inches of rain** resulting from the remnants of Hurricane Florence.	
November 8, 2018	October 11, 2018	Crest gauge data along with wrack, sediment, and laid-back vegetation indicate a bankfull event after 2.79 inches of rain** resulting from Hurricane Michael.	3
November 13, 2019	October 31, 2019	Crest gauge data along with visual evidence throughout the site indicate an overbank event occurred after approximately 3.15 inches of rain***	4
February 17, 2020	January 12, 2020	Crest gauge data along with wrack and laid-back vegetation indicate a bankfull event after 1.79 inches of rain**	5
May 28, 2020	May 20, 2020	Wrack observed on TOB and in floodplain of Walton- Crawley Branch after approximately 5.90 inches of rain documented over 2 days	6

Table 13. Wetland Hydrology Criteria Attainment Summary Neighbors Branch/Walton Crawley Branch Site (DMS Project Number 92872)

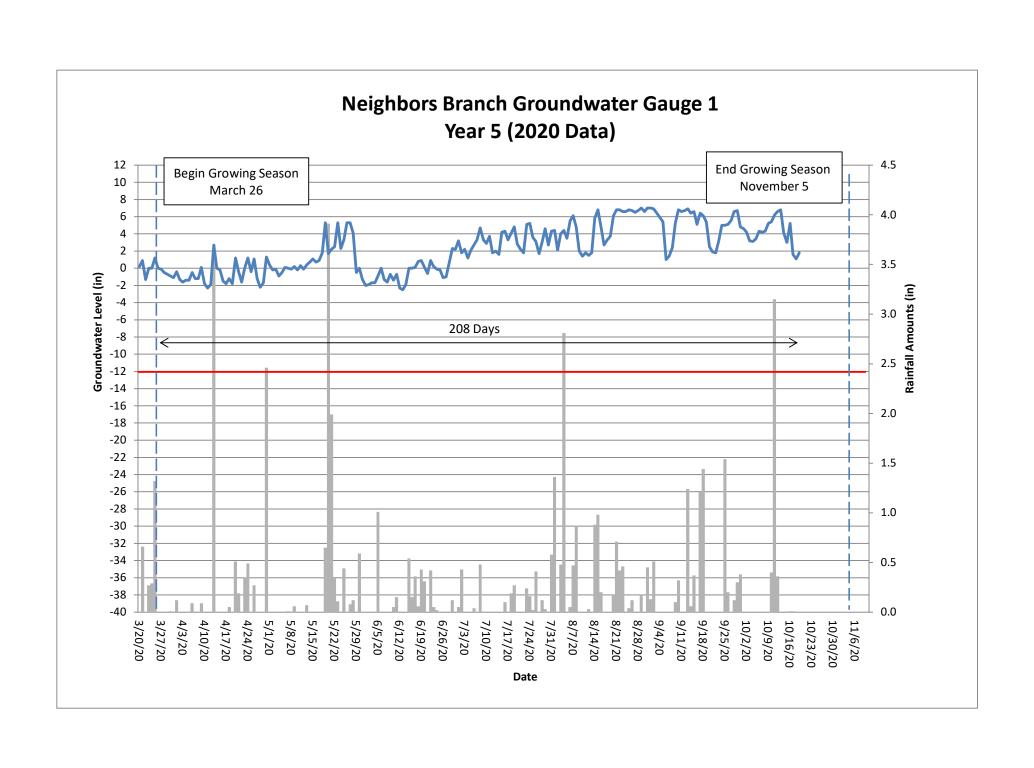

Gauge	Success Criteria Achieved/Max Consecutive Days During Growing Season (Percentage)				
	Year 1 (2016)	Year 2 (2017)	Year 3 (2018)	Year 4 (2019)	Year 5 (2020)
1	Yes/208 Days (92.4%)	Yes/225 Days* (100%)	Yes/225 Days** (100%)	Yes/181 Days (80%)	Yes/208 Days (92.4%)
2	Yes/164 Days (72.9%)	Yes/225 Days (100%)	Yes/225 Days^ (100%)	Yes/181 Days (80%)	Yes/208 Days (92.4%)

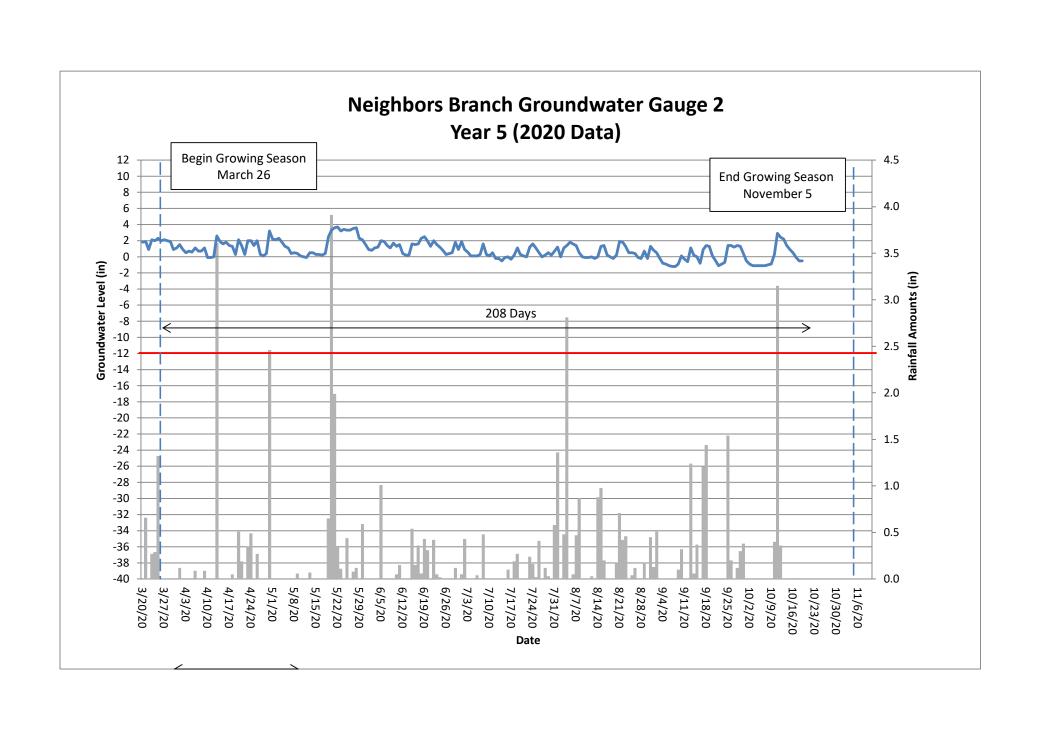

^{*}Gauge 1 malfunctioned for 6 days (July 29 to August 3, 2017); however, based on precipitation data as well as data from Gauge 2, it is expected that this gauge would have continued to be saturated/inundated during this 6 day period.

**Gauge 1 batteries died several time throughout the growing season due to excessive inundation resulting in data loss; however, groundwater was at or near the soil surface for the entire 2018 growing season.

^Gauge 2 missed several days of data collection due to a malfunction caused by excessive inundation during the remnants of Hurricane Florence. It began collecting points again once overbank flow receded.

Progress Report for Neighbors Branch (DMS #92872) and Bobs Creek (DMS #92879) Invasive Vegetation Management

15 August 2019:

Jason York worked at Bob's Creek. A foliar spray using 3% glyphosate (Rodeo) was applied to privet (*Ligustrum sp.*) and multiflora rose (*Rosa multiflora*) on the field edges and banks of Bobs Creek in polygons 3 and 4 (see attached map). A small patch of privet was found in polygon 5 along the stream bank. Stems were either hand-pulled or cut and stump treated with 50% glyphosate in an area approximately 150 sq. feet. Polygon 6 was inspected and only one stem of tree of heaven (*Ailanthus altissima*) was found and was cut and stump treated with 50% glyphosate. Polygon 9 was also inspected, and no invasive species were found. In total 4 gallons of 3% glyphosate and 12 ounces of 50% glyphosate were used.

4 September 2019:

Jason York worked at Neighbors Branch in polygon 6, where a moderately dense infestation of tree of heaven is located. Mechanical applications (cut stem and hack and squirt) were performed using 50% glyphosate. Individual stems are scattered throughout the polygon but concentrated along the stream channel and road. 84 ounces of 50% glyphosate were used.

19 September 2019:

Jason York and Holland Youngman worked at Neighbors Branch in polygons 6, 9, and 10. Foliar spray using 3% glyphosate was applied to the "vegetation problem areas" in polygon 9. This consisted of mostly privet, although one stem of tree of heaven was encountered and treated using the hack and squirt method with 50% glyphosate. Foliar spray was applied from the edges of the areas (the road and along the stream side) and a repeat treatment will be done after the initial spray has defoliated the privet and exposes stems growing in the "interior" of the dense patches. A few scattered stems of multiflora rose were also found. A small patch of kudzu (*Peuraria montana*) is located near the wetland area towards the upstream end of the first "vegetation problem area." This was foliar sprayed along with the privet; however, it will most likely need retreatment and mechanical removal as kudzu does not always respond well to glyphosate. Several small privet stems were either hand-pulled or stump treated with 50% glyphosate in the "veg problem area" on the western side of the stream channel. The infestation has

spread beyond the previously identified boundaries and will require further mechanical and chemical treatment.

A kudzu patch along the road between polygon 9 and 10 was foliar sprayed using 4% triclopyr (Element 3A). The patch extends uphill towards the private residence and was sprayed along the eastern side of the road up to the point where the easement diverges from the gravel road. Polygon 10 was inspected and only two small stems of multiflora rose were found and stump treated using 50% glyphosate.

Mechanical applications continued in polygon 6 on tree of heaven. Approximately ¾ of the stems have been treated. Some stems remain untreated towards the uphill part of the polygon.

In total 8 gallons of 3% glyphosate, 4 gallons of 4% triclopyr, and 21 ounces of 50% glyphosate were used.

25 September 2019:

Jason York and Holland Youngman worked at Bob's Creek in polygons 1, 2 (UT 8), 3, and 4. Foliar spray and mechanical applications were used on privet, multiflora rose, tree of heaven, and autumn olive (*Eleagnus umbellata*) in polygons 1 and 2. Two mature shrubs of autumn olive were found in polygon 1 and were sprayed. Follow up foliar spray and cut stem treatment were performed in polygons 3 and 4 on Privet, multiflora rose, and Ailanthus. The field edge of polygon 5 was sprayed and contained privet and multiflora rose.

14 November 2019:

Jason York and Holland Youngman worked at Neighbor's Branch in polygons 1, 2, 3, and 4. Two stems of tree of heaven were found halfway up the eastern UT in polygon 4. The stems were cut and treated with 50% glyphosate. A second population of tree of heaven was found along the easement boundary with polygon 5 and consisted of approximately three dozen stems. Privet and multiflora rose stems were scattered throughout polygon 4. All stems were cut and treated with 50% glyphosate. Polygon 2 contained several multiflora rose and privet stems. These stems were either cut and treated with 50% glyphosate or were hand-pulled and piled. No invasive plant species were found in polygons 1 and 3. 30 ounces of 50% glyphosate were used. Follow-up treatment is needed Polygon 9 and will consist of additional cut stem work on privet and foliar spray in the spring of 2020.

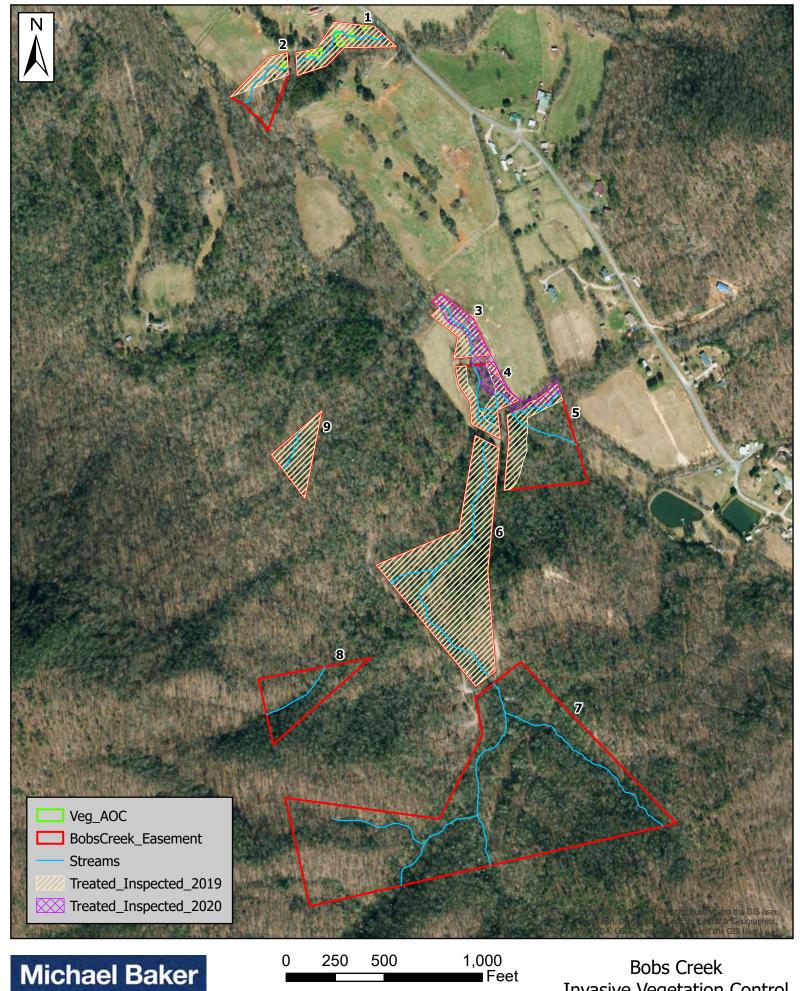

19 December 2019:

Jason York and Victoria Hoyland worked at Neighbors Branch in the northern veg problem areas of Polygon 9 between the Walton Crawley Branch and the gravel road to the east. Privet that had been previously sprayed was cut and piled to expose smaller sprouts and living shrubs previously covered by larger privet. This also allows for root sprouts to be easily found and sprayed in the spring of 2020. Living privet was cut and stems were treated with 50% glyphosate. A total of 60 ounces of 50% glyphosate were used. This concludes our work for the billing period of September – December 2019. Additional mechanical work may be done at Neighbors Branch during the winter months of 2020. Follow-up treatment with foliar spray will begin after privet stems have fully foliated in the late spring of 2020.

17 April 2020:

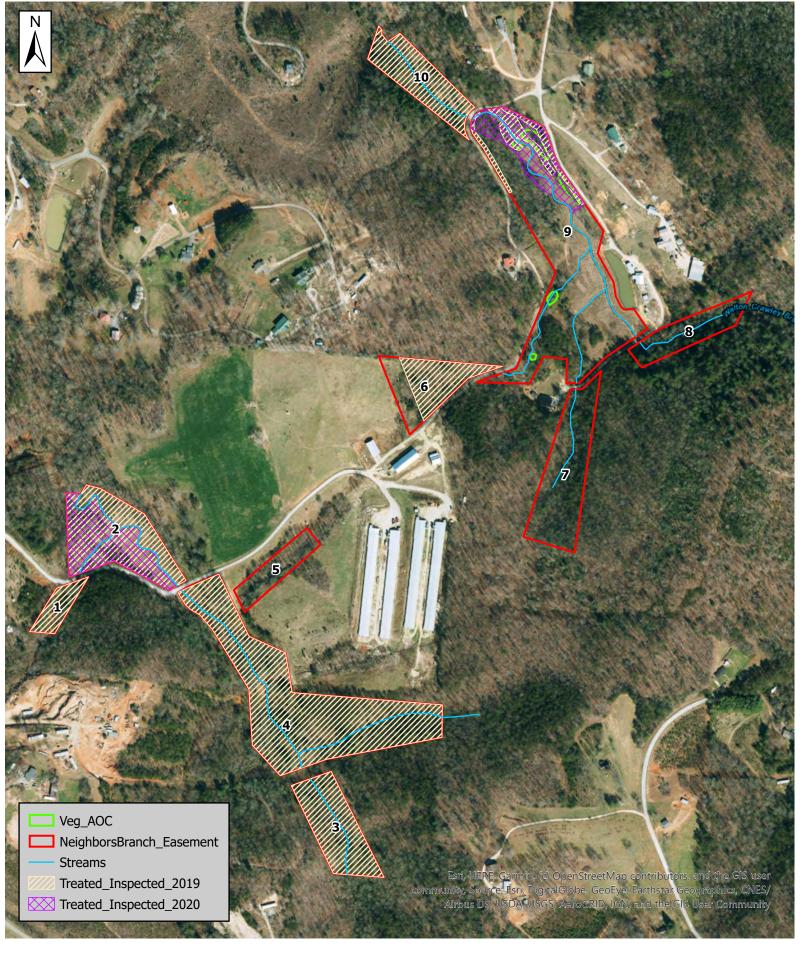

Jason York and Holland Youngman worked at the Neighbors Branch and Bob's Creek easements. Privet was treated with a foliar spray of 3% glyphosate in polygon 9 along the mainstem. Some larger stems were treated mechanically using the hack and squirt method. Polygon 2 was also treated with foliar spray and contained several large multi-flora rose shrubs. Some small privet stems were also treated in this polygon. Oriental bittersweet (*Celastrus orbiculatus*) was found for the first time in polygon 2 and was sprayed. 12 gallons of 3% glyphosate and 32 oz of 50% glyphosate were applied at Neighbors Branch.

We next applied foliar spray at Bob's Creek along the mainstem and along the border of the easement in polygons 3, 4, and 5. Multi-flora rose was the main target species although some privet was encountered and sprayed. 8 gallons of 3% glyphosate was applied at Bob's Creek.
