### 1.0 EXECUTIVE SUMMARY / PROJECT ABSTRACT

In 2002, the North Carolina Department of Transportation identified the Unnamed Tributary (UT) to Bear Creek Site (Phillips) in Chatham County, North Carolina as a potential stream restoration project. The 1.7-square mile watershed is located within the USGS 8-digit HUC 03030003 and the NCDWQ Subbasin 03-06-12 of the Cape Fear River Basin. The project restored approximately 2,378 linear feet of channel - 1,921 feet on UT Bear Creek and 457 feet on unnamed tributary 2 (UT2) - and enhanced an additional 935 feet of channel on UT2. The NCDOT completed project construction in 2006, after which the project was transferred to the North Carolina Ecosystem Enhancement Program (EEP). Project goals and objectives are listed below:

Project Goals:

- Improve water quality.
- Improve riparian and in-stream habitat

Project Objectives:

- Excluding cattle from the stream channels.
- Increasing channel stability.
- Restoring dimension, pattern, and profile to UT Bear Creek and UT 2.

The riparian buffer was planted with five different species of bare root trees and two different species of live stakes. Seven vegetation monitoring plots were established in 2009, the first year of monitoring. These plots were set up following the Carolina Vegetation Survey (CVS) vegetation monitoring protocol. Based on the seven monitoring plots, the fifth-year monitoring counted an average of 399 planted stems/acre across the site. Plot 7 is the only plot that has a planted stem density less than the year five success criteria of 260 stems/acre. This plot has 202 planted stems/acre and 1,052 total stems/acre, including volunteers. The site's average stem density including volunteers is 1,549 stems/acre. Three prominent exotic invasive species found within the project buffer are Chinese privet (*Ligustrum sinense*), Japanese honeysuckle (*Lonicera japonica*), and microstegium (*Microstegium vimineum*), with the privet being especially thick in certain areas. The areas of privet have been mapped on the CCPV. Plot 4 contains one stem of princess tree (*Paulownia tomentosa*). The presence of this invasive species is limited and is not widespread throughout the site. Supplemental planting of the site was conducted in November of 2013. Five separate zones were planted throughout the easement totaling approximately 0.9 acres. Please see Appendix C for the Supplemental Planting List and Plan.

There are two hydrologic features on the site. The first, UT Bear Creek, has been restored by altering the dimension, pattern, and profile and is controlled vertically by numerous bedrock outcrops and cross vanes. The second feature is UT 2 and it has been divided into two reaches, UT 2A, which was enhanced, and UT 2B, which was restored. UT 2A is a straight channel that begins at Station 30+00. This reach already had banks stabilized by the mature trees that line both sides of the channel for the length of the reach. This reach was enhanced by planting native vegetation in the riparian buffer beyond the top of bank. UT 2B begins where UT 2A ends at the ford crossing at Station 39+75. This reach was restored by changing the dimension, pattern and profile of the channel from the ford to the confluence with UT Bear Creek.

During the fifth-year monitoring the site was also examined for stream stability and potential problem areas. UT Bear Creek is predominantly stable throughout the project. There is one area of floodplain erosion that has been noted in previous reports and is no longer active. The area has now filled in with vegetation. The beaver dam noted in previous year's monitoring reports that was creating backwater conditions in the lower portions of UT Bear Creek has been removed. The areas that had been flooded and had low planted stem density have been replanted. UT 2 is predominantly stable. There are two

localized areas of erosion and bed degradation on UT 2. The first is at the cross vane at Station 40+00 and the second area is along the channel at Station 43+00 where there is a small head cut.

Summary information/data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the Baseline Monitoring Report (formerly Mitigation Plan) and in the Mitigation Plan (formerly the Restoration Plan) documents available on the EEP's website. All raw data supporting the tables and figures in the appendices are available from EEP upon request.

#### 2.0 METHODOLOGY

The Level 2 CVS-EEP protocol (<u>http://cvs.bio.unc.edu/methods.htm</u>) was used to collect vegetation data from UT Bear Creek.

DESCRIPTION OF WORKSHE	ETS IN THIS DOCUMENT
Metadata	Description of database file, the report worksheets, and a summary of project(s) and project data.
Proj, planted	Each project is listed with its PLANTED stems per acre, for each year. This excludes live stakes.
Proj, total stems	Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems.
Plots	List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.).
Vigor	Frequency distribution of vigor classes for stems for all plots.
Vigor by Spp	Frequency distribution of vigor classes listed by species.
Damage	List of most frequent damage classes with number of occurrences and percent of total stems impacted by each.
Damage by Spp	Damage values tallied by type for each species.
Damage by Plot	Damage values tallied by type for each plot.
Planted Stems by Plot and Spp	A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded.
ALL Stems by Plot and spp	A matrix of the count of total living stems of each species (planted and natural volunteers combined) for each plot; dead and missing stems are excluded.

### Supplemental Planting Plan UT Bear Creek (Phillips) EEP #32719 Chatham County, NC May 2013

2427 Edward Mill Church Rd Siler City NC 27344

# Appendix D

# Hydrologic Data

Table 11. Verification of Bankfull Events         Project Number and Name: 92719 - UT Bear Creek (Phillips)										
Date of Data	Date of	-	Photo							
Collection	Occurrence	Method	Number							
11/17/2009	11/13/2009	Site visit to evaluate indicators of stage after storm events	N/A							
10/8/2010	9/30/2010	Site visit to evaluate indicators of stage after storm	N/A							
8/16/2011	unknown	Crest gauge	N/A							
11/5/2012	unknown	Crest gauge	N/A							

Due to the frequent beaver activity throughout the site, many parts of the site have had extended periods of backwater, therefore it has been difficult to determine bankfull events. From examining precipitation data in 2013 from the Siler City Airport weather station, it is likely that a 2.33" rain event on August 21, 2013 produced a bankfull event.
