1.0 EXECUTIVE SUMMARY / PROJECT ABSTRACT

The Unnamed Tributary to Crooked Creek (UTCC) in Franklin County, NC was identified as a restoration design project in 2004. The 0.52-mi² project watershed is located within the USGS 8-digit HUC 03020101 and the NCDWQ Sub-basin 03-03-01 of the Tar-Pamlico Basin. The project restored and preserved streams, restored riparian buffer, and created and preserved wetlands. The project goals and objectives are listed below.

- Restore the degraded channel to a stable, functioning channel by using Natural Channel Design principles.
- Enhance the ability of aquatic fauna and flora to survive and flourish by replacing the existing degraded stream habitat with a stable stream channel and riparian buffer that is more conducive to propagation.
- Restore a healthy, vegetated riparian community to the currently denuded, fallow floodplain and adjacent hill slopes.
- Enhance existing wetlands by planting supplementary vegetation.
- Preserve in perpetuity, through a conservation easement, lands surrounding the UTCC that will soon be impacted by residential development.

The previously unvegetated portion of the conservation easement, including the buffer restoration and wetland creation areas, was planted with an appropriate mix of bare root and live stake species. Three vegetative plots were established during the baseline monitoring to determine the vegetative success of the site. Four additional plots were established in the fourth year of monitoring so that the site met the recommended number of plots based on the EEP-CVS monitoring protocol. The fourth-year monitoring of these plots revealed an average density of 382 total planted stems/acre and minimal coverage by invasive vegetation. Due to the age of this site, this site has been grandfathered in and is allowed to count buffer restoration credit up to 200 feet away from the stream, which means that all of the plots must meet a success criterion of 320 stems/acre. Vegetation Plots 1 and 2 are not meeting this criterion. However, these two plots have extensive volunteer populations and densities over 680 total stems/acre, when including volunteers. Across the site there is good vegetative coverage. There are plentiful volunteers, with some dense stands of young loblolly pine (*Pinus taeda*). Many parts of the stream have vegetation growing in the channel, including some pools with cattails (Typha latifolia). The vegetation growing in the channel obscures the thalweg location in places, but overall is not adversely affecting the project. Some areas with low planted stem densities have been noted in this report. These areas are most frequently found on the excavated floodplain, where the soil quality is generally low. These findings indicate that the vegetation component of the site is on track to meeting the project's success criteria.

In 2009, the EEP completed a Buffer Audit Verification of the site, during which several field visits were made to delineate wetland soils, estimate the extent of buffer planting and locate stream preservation reaches. This audit has been updated throughout the 2010 monitoring. This monitoring report includes the findings of this verification, and Table 1 has been changed to reflect the updated mitigation units. The wetland creation and preservation areas do not have additional monitoring requirements.

The stream monitoring at the site involves surveying eight permanent cross-sections and a longitudinal profile along the entire length of UTCC. The stream assessment completed during the fourth year of monitoring found the stream to be functioning and holding grade. The site does not have any bank erosion problems or widespread bed incision or aggradation. Throughout the monitoring history of this project there have been a series of beaver dams constructed on the project channel. The beavers have been removed and the dams have been breached. Most of these dams collected fine sediment behind them, which caused small areas of bed aggradation. These breached beaver dams still create areas of backwater in the channel, which have been mapped on the Current Condition Plan View (CCPV). Another beaver dam is located below the restored channel, and it is causing backwater conditions in the downstream

1

portion of the lower reach. In 2011, EEP will conduct maintenance planting and remove active and relic beaver dams at the site.

Summary information and data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the mitigation and restoration plan documents available on the EEPs website. All raw data supporting the tables and figures in the appendices are available upon request.

2.0 METHODOLOGY

The Level 2 CVS-EEP protocol (http://cvs.bio.unc.edu/methods.htm) was used to collect vegetation data from UT to Crooked Creek this year, the fourth year of monitoring.

The profile was stationed by thalweg length and then adjusted to match grade control structures between monitoring years.

Visual Assessment Data

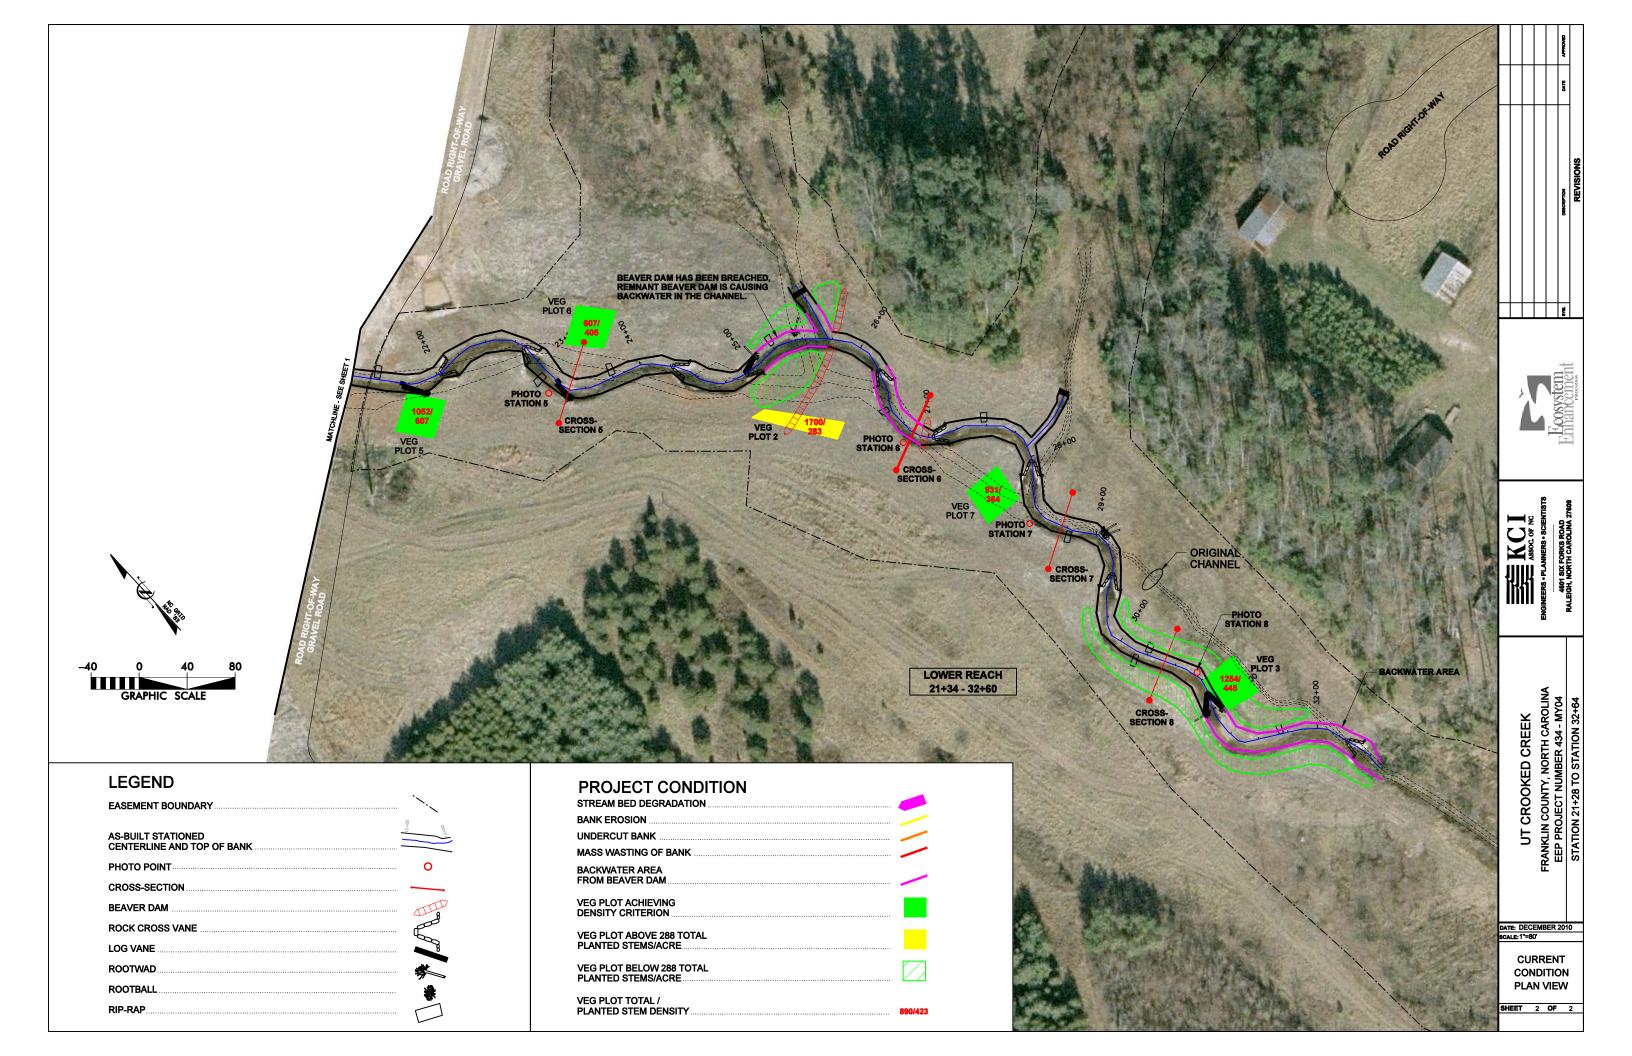

Table 5. Visual Stream Morphology Stability Assessment Project Number and Name: 434 - UT to Crooked Creek

Project linear footage ** 2,219

Major Channel	Channel Sub-Category	Metric	Stable, Performing as Intended	Total Number in As-built	Number of Unstable Segments	Amount of Unstable Footage	% Stable, Performing as Intended	Stabilizing Woody Vegetation	Stabilizing Woody Vegetation	Adjusted % for Stabilizing Woody Vegetation
1. Bed	1. Vertical Stability (Riffle and Run units)	Aggradation - Bar formation/growth sufficient to significantly deflect flow laterally (not to include point bars)			0	0	100%			
		2. <u>Degradation</u> - Evidence of downcutting			0	0	100%			
	2. Riffle Condition*	1. <u>Texture/Substrate</u> - Riffle maintains coarser substrate	18	30			60%			
	3. Meander Pool Condition	1. <u>Depth Sufficient (Max Pool Depth : Mean Bankfull Depth ≥ 1.6)</u>	40	32			125%			
		2. <u>Length</u> appropriate (>30% of centerline distance between tail of upstream riffle and head of downstream riffle)	40	32			125%			
	4.Thalweg Position ⁺	1. Thalweg centering at upstream of meander bend (Run)	N/A	N/A			N/A			
		2. Thalweg centering at downstream of meander (Glide)	N/A	N/A			N/A			
2. Bank	1. Scoured/Eroding	Bank lacking vegetative cover resulting simply from poor growth and/or scour and erosion			0	0	100%	0	0	100%
	2. Undercut	Banks undercut/overhanging to the extent that mass wasting appears likely. Does <u>NOT</u> include undercuts that are modest, appear sustainable and are providing habitat.			0	0	100%	0	0	100%
	3. Mass Wasting	Bank slumping, calving, or collapse			0	0	100%	0	0	100%
				Totals	0	0	100%	0	0	100%
3. Engineered Structures	1. Overall Integrity	Structures physically intact with no dislodged boulders or logs.	26	26			100%			
	2. Grade Control	Grade control structures exhibiting maintenance of grade across the sill.	26	26			100%			
	2a. Piping	Structures lacking any substantial flow underneath sills or arms.	26	26			100%			
	3. Bank Protection	Bank erosion within the structures extent of influence does <u>not</u> exceed 15%. (See guidance for this table in EEP monitoring guidance document)	26	26			100%			
	4. Habitat	Pool forming structures maintaining \sim Max Pool Depth: Mean Bankfull Depth ratio \geq 1.6 Rootwads/logs providing some cover at base-flow.	26	26			100%			

^{*}Since all of the riffles are sand riffles and mostly covered with vegetation, this metric identifies all of the stable riffles that were identified during the longitudinal profile survey. The total number of as-built riffles has been estimated from the as-built profile and planview sheets.

⁺The exact position of the thalweg in relation to the pattern is not a factor in channl stability for this stream. All of the banks are well vegetated and stable. Most of the riffles having rooted vegetation growing in them, which obscures the exact position of the thalweg.

^{**}This evaluation only includes the length of the mainstem and not the portions of restoration on the small tributaries.

DESCRIPTION OF WORKSHEETS IN	THIS DOCUMENT
Metadata	Description of database file, the report worksheets, and a summary of project(s) and project data.
Proj, planted	Each project is listed with its PLANTED stems per acre, for each year. This excludes live stakes.
Proj, total stems	Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems.
Plots	List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.).
Vigor	Frequency distribution of vigor classes for stems for all plots.
Vigor by Spp	Frequency distribution of vigor classes listed by species.
Damaga	List of most frequent damage classes with number of occurrences and percent of total
Damage	stems impacted by each.
Damage by Spp	Damage values tallied by type for each species.
Damage by Plot	Damage values tallied by type for each plot.
Planted Stems by Plot and Spp	A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded.
ALL Stems by Plot and spp	A matrix of the count of total living stems of each species (planted and natural volunteers combined) for each plot; dead and missing stems are excluded.
