1.0 INTRODUCTION AND SCOPE

This fine particulate matter (PM_{2.5}) redesignation demonstration and maintenance plan covers the Hickory PM_{2.5} nonattainment area (Catawba County) and the Greensboro/Winston Salem/High Point PM_{2.5} nonattainment area (referred to as the Triad area and consisting of Davidson and Guilford Counties). On-road mobile sources produce nitrogen oxides (NO_x), particles less than 2.5 micrometers in diameter (PM_{2.5}), and sulfur dioxide (SO₂), along with a host of other pollutants. Emissions of these pollutants are estimated in the mobile source inventory required for the maintenance plan. Mobile sources comprise about 74% of the nitrogen oxides (NO_x) emissions in the Hickory and Triad PM_{2.5} nonattainment areas. The scope of this document covers only the procedures associated with on-road mobile sources.

2.0 OVERALL METHODOLOGY

2.1 EMISSION ESTIMATION APPROACH

Mobile source emissions are estimated by the methodologies suggested in the United States Environmental Protection Agency (USEPA) document Emissions Inventory Guidance for Implementation of Ozone and Particulate Matter National Ambient Air Quality Standards (NAAQS) and Regional Haze Regulations. The estimation of emissions from mobile sources involves multiplying an activity level by an emission factor.

For on-road or highway mobile sources, the USEPA mobile model MOBILE6.2 is used to generate emission factors which are multiplied by the vehicle miles traveled (VMT) to determine the estimated emissions.

The North Carolina Division of Air Quality (NCDAQ) is aware that the USEPA has a new mobile model, MOVES, on the horizon. This model is expected to become final in December 2009, at which time a grace period for use of MOVES as the new regulatory model will be announced. The NCDAQ commits to providing supplemental data to this submission when MOVES is released and approved for regulatory purposes.

3.0 QUALITY ASSURANCE MEASURES

The quality assurance (QA) for the highway mobile source category can be broken into three components: 1) input files, 2) MOBILE6.2 outputs/summaries, and 3) VMT interpolation. Each of these components are detailed in the paragraphs below.

After the speed and VMT information is acquired from the North Carolina Department of Transportation (NCDOT), the speed information is checked for reasonableness against previous sets of speeds for the areas. Once comfortable with the speeds, the NCDAQ enters the speed information into MOBILE6.2 input files. In addition to the speed information, the following inputs are included in the input files: pollutants, fuel Reid Vapor Pressure (RVP), 24-hour temperature and relative humidity profiles, barometric pressure, inspection and maintenance program, anti-tampering program, calendar year, evaluation month, and the vehicle mix per road type. All input files are printed and checked by hand against a “key” with the original source of the information. This QA step is always performed by a person other than the one who generated the files. If any discrepancies are found, they are marked on the hard copy and given back to the person who generated the input files for correction. Vehicle age distribution is a reference file in the MOBILE6.2 input file. This referenced file is checked against the original spreadsheet from which it is generated. Again, if any discrepancies are found, they are noted and returned to the person responsible for generating the input files.

Once the input files have passed through the QA procedure, MOBILE6.2 is run to generate emission factors. The emission factors are output into two forms from the MOBILE6.2 model. One set of outputs is formatted for importing into a spreadsheet. Once in the spreadsheet, data can easily be formatted into summary tables. An additional step in the spreadsheet is to multiply the emission factors by the daily VMT to get daily emissions. The next QA step is then performed by comparing the summary tables containing emission factors to the other MOBILE6.2 “descriptive” output file (also referred to as the “text output”).

A final QA step is to check the VMT used in the preceding step in the summary spreadsheets against the original source of the VMT. If VMT was not provided for the specific years requested, then the NCDAQ performs a linear interpolation to calculate VMT for the exact year needed. This linear interpolation is checked by a person other than the one who generated the file to ensure no errors were introduced.

4.0 DISCUSSION OF ON-ROAD MOBILE SOURCES

On-road mobile sources produce NO_x, PM_{2.5}, and SO₂, along with a host of other pollutants. Emissions of these three significant pollutants are estimated in the on-road mobile source inventory for the maintenance plan. The objective of the following section is to describe the source category and the emissions estimation procedures. This section also includes tables summarizing the estimated emissions for the projection years by county. Section 5 contains copies of the data used in the calculation of the estimated emissions, such as the MOBILE6.2 mobile model input and output files.

4.1 Introduction and Scope

On-road highway mobile sources are considered as those vehicles that travel on the roadways. On-road mobile sources are a major contributor to NO_x emissions in North Carolina and a less significant contributor to primary PM_{2.5} and SO₂. Emissions from motor vehicles occur throughout the day while the vehicle is in motion, at idle, parked, and during refueling. All of these emissions processes need to be estimated in order to properly reflect the total emissions from this source category.

On-road mobile source emissions comprise a small percentage of the total fine particulate matter emissions for all of North Carolina. Particulate emissions from motor vehicles only occur while the vehicle is moving or idling. These emissions are direct tailpipe (from both gas and diesel fuel vehicles), sulfate, tire wear, and brake wear. Only direct particulate emissions processes will be estimated in order to properly reflect the total fine particulate matter emissions from this source category.

The USEPA developed the MOBILE model to estimate emission factors based on information on the way vehicles are driven in a particular area. The latest version of the MOBILE model (MOBILE6.2) was used. This model was released by the USEPA in 2002 and differs significantly from previous versions of the model. Key inputs for MOBILE6.2 include information on the age of vehicles on the roads, the average speed of those vehicles, what types of roads those vehicles are traveling on, any control technologies in place in an area to reduce emissions for motor vehicles (e.g., emissions inspection programs), and ambient temperature.

MOBILE6.2 particulate outputs contain both primary particulates (soot from tailpipes, tire, and brake wear) and secondary (particulate precursors). Secondary particulate matter is formed by chemical reactions of gas-phase precursors in the atmosphere. The specific primary outputs are GASPM, i.e. particles directly emitted from all gasoline vehicles, OCARBON (organic carbon) and ECARBON (elemental carbon) from diesel engines, sulfate (SO₄) from both fuels, and tire and brake dust from all vehicles.

A very important component of the highway mobile emission estimation process is interagency consultation. The primary transportation partners involved in the Hickory and Triad redesignation interagency consultation process included: NCDOT, USEPA, Federal Highway Administration (FHWA), Greensboro MPO, High Point MPO, Piedmont Triad RPO, and Greater Hickory MPO. Specifically the NCDOT was consulted for input data such as speeds and VMT for the rural counties where the Hickory and Triad Travel Demand Models (TDMs), the urban travel demand models, did not cover. The rural areas include parts of Catawba and Davidson

Counties. Model inputs were summarized and sent to the partners on February 17, 2009. Also, an interagency consultation conference call was held February 26, 2009 to discuss the specific details of the MOBILE6.2 model inputs used to estimate the highway mobile source emissions, as well as issues concerning the setting of motor vehicle emissions budgets (MVEBs). In September 2009, the NCDAQ received new speeds and VMT from Catawba County that were run in anticipation of the Hickory area conformity determination. Since this PM_{2.5} Redesignation package had not been submitted at that point, the updated speeds were incorporated. Additionally at that time, the NCDAQ decided to make a change to a future year modeled. The final year of the plan was changed from 2020 to 2021, due to the timing of the submission. Speeds and VMT were requested and received for Davidson and Guilford County at that time and 2021 runs were performed.

4.2 MOBILE6.2 Input Assumptions

The MOBILE6.2 input files and output files are compiled in Section 5 – Data.

4.2.1 Speed Assumptions

Emissions from motor vehicles vary with the manner in which the vehicle is operated. Vehicles traveling at 65 miles per hour (mph) emit a very different mix of pollutants than the car that is idling at a stoplight.

The speeds for the urban areas covered by the MPOs were generated from each region's TDM. The modeled speeds for Guilford and Davidson were provided by Piedmont Authority for Regional Transportation (PART) for the desired maintenance plan years. Speeds for rural areas in Catawba and Davidson County were generated by NCDOT. Modeled speeds for urban areas of Catawba county were received for the years 2007, 2015, 2025, and 2035, and interpolated to the years needed. The MOBILE6.2 model was utilized to generate emission factors for both nonattainment areas. Tables 4.2.1-1 through 4.2.1-5 provide a summary of the speeds.

Table 4.2.1-1 Modeled Area Speeds for Davidson County (miles/hour)

Functional Class	2008	2011	2014	2017	2021

The MOBILE6.2 command “AVERAGE SPEED” was used to enter the daily speeds provided. This command requires two data elements: average speed and a roadway scenario. As with all average speed inputs to MOBILE6.2, average speeds may range from 2.5 to 65 miles per hour. The roadway scenario data element indicates the type of driving that the user intends for the average speed input to the model. The NCDAQ and the NCDOT followed the USEPA Technical Guidance on the Use of MOBILE6.2 for Emission Inventory Preparation (Office of Transportation, and Air Quality EPA420-R-04-013, August 2004) to match FHWA roadways to MOBILE6.2 driving cycles with the exception of local roads. For local roads, the NCDAQ used arterial/collector roadway scenario, in accordance to the above mentioned USEPA guidance found on page 30:

Note that the MOBILE6.2 driving cycle used for local roadways may differ from the range of activity on the roadways defined as local by USDOT Publication No. FHWA-ED-90-006 revised March 1989 (Highway Functional Classification) for both rural and urban local VMT. The local roadway driving cycle used in MOBILE6.2 likely constitutes only a small subset of urban local VMT as defined by FHWA. When in doubt, EPA recommends that any roadway VMT that does not clearly match the MOBILE6.2 driving cycle for local roadways be included with MOBILE6.2 arterial/collector VMT rather than included with MOBILE6.2 local roadway VMT.

Roadway scenarios per facility type are defined as follows:

Rural interstate	Non-Ramp
Rural principle arterial	Non-Ramp
Rural minor arterial	Arterial
Rural major collector	Arterial
Rural minor collector	Arterial
Rural local	Arterial
Urban interstate	Non-Ramp
Urban freeway	Non-Ramp
Urban principle arterial	Arterial
Urban minor arterial	Arterial
Urban collector	Arterial
Urban local	Arterial

Interstates are modeled as “Non-Ramp” instead of “Freeway” because both speed and VMT for ramps are included in the functional classification for the major facility it is connected to in the travel demand models. This is consistent with the August 2004 USEPA guidance mentioned above.

4.2.2 Vehicle Age Distribution

The vehicle age distribution comes from annual registration data for North Carolina from the NCDOT. For this analysis the age distribution was generated based on 2007 data, the latest available count data at the time. The NCDOT provided the data based on the number of vehicle types per year from 1974 through 2007. Vehicles greater than 25 years old were combined and included as the 25th model year. The vehicle count information is provided for nine vehicle types; light duty gas vehicles (LDGV), light duty diesel vehicles (LDDV), light duty gas trucks 1 (LDGT1), light duty gas trucks 2 (LDGT2), light duty diesel trucks 1 (LDDT1), light duty diesel trucks 2 (LDDT2), heavy duty gas vehicles (HDGV), heavy duty diesel vehicles (HDDV) and motorcycles (MC). LDDT1 and LDDT2 are combined and labeled as light duty diesel trucks (LDDT).

4.2.3 Vehicle Mix Assumptions

The vehicle mix refers to the percentage of different vehicle types on each of the 12 FHWA road types. These road types are listed above in the speed assumptions section. It is critical for

estimating on-road mobile emissions in an area to use data that accurately reflects the vehicles types traveling on each of these different road types.

In August 2004, the USEPA released the guidance document EPA420-R-04-013, Technical Guidance on the Use of MOBILE6.2 for Emission Inventory Preparation, which outlines how to convert the Highway Performance Monitoring System (HPMS) traffic count data to MOBILE6.2 vehicle mix data. Outlined below is the methodology used to convert the 13 HPMS vehicle types count data reported to FHWA and generate a state specific vehicle mix.

The North Carolina HPMS data used to generate the new statewide vehicle mix was based on 2007 data counts. This is the latest available statewide count information at the time of the modeling. Table 4.2.3-1 shows the percent of vehicles per vehicle type for each of the 12 road classes.

Table 4.2.3-1 2007 North Carolina HPMS Data

Functional Classification	MC	Cars	2A4T	Bus	2ASU	3ASU	4ASU	4AST	5AST	6AST	5AMT	6AMT	7AMT

4.2.4 Disaggregating State Specific Information

Section 4.1.5 of Technical Guidance on the Use of MOBILE6.2 for Emission Inventory Preparation, illustrates how to map the HPMS statewide vehicle data to general MOBILE6.2 vehicle categories. This mapping is outlined below:

Table 4.2.4-1 Mapping of HPMS data to MOBILE6.2 Categories

HPMS Category	General Category
Motorcycle	Motorcycle (MC)
Passenger Car	Passenger Car (LDV)
Other 2-Axel, 4-Tire Vehicles	Light Truck (LDT)
Busses	Bus (HDB)
All Other Trucks: Single unit, 2-axel, 6-tire Single unit, 3-axel Single unit, 4 or more axel Single trailer, 4 or fewer axel Single trailer, 5-axel Single trailer, 6 or more axel Multi-trailer, 5 or fewer axel Multi-trailer, 6-axel Multi-trailer, 7 or more axel	Heavy Duty Truck (HDV)

The HPMS data in Table 4.2.3-1 was grouped into these five general categories for each road type. In order to expand the five general categories to the 16 vehicle types used in MOBILE6.2, the national average VMT fractions by each vehicle class were used. The 2007 fractions were used since the state specific data is from 2007. The national average data was obtained from Table 4.1.2 in Technical Guidance on the Use of MOBILE6.2 for Emission Inventory Preparation. An example for rural interstates is illustrated below:

From Table 4.2.3-1 above:

Passenger Cars	=	59.00%	5 axel Trailer	=	18.71%
Pickup Trucks	=	13.37%	6 axel Trailer	=	0.78%
Bus	=	1.10%	5 axel Multi Trailer	=	0.63%
2 axel Trucks	=	2.84%	6 axel Multi Trailer	=	0.27%
3 axel Trucks	=	0.75%	7 axel Multi Trailer	=	0.19%
4 axel Trucks	=	0.05%	Motorcycles	=	0.37%
4 axel Trailer	=	1.92%			

Therefore, the five general categories are:

Motorcycles	=	0.37%
Light Duty Vehicles	=	59.00%
Light Duty Trucks	=	13.37%
Heavy Duty Buses	=	1.10%
Heavy Duty Vehicles	=	26.16%

From Table 4.1.2 in Technical Guidance on the Use of MOBILE6.2 for Emission Inventory Preparation, the 2007 national average vehicle mix for light duty trucks, buses and heavy duty trucks are:

Light Duty Trucks			Heavy Duty Trucks		
LDT1	=	0.0822	HDV2B	=	0.0387
LDT2	=	0.2735	HDV3	=	0.0038
LDT3	=	0.0843	HDV4	=	0.0031
LDT4	=	0.0388	HDV5	=	0.0023
Total	=	0.4788	HDV6	=	0.0086
			HDV7	=	0.0102
			HDV8A	=	0.0111
			HDV8B	=	0.0396
			Total	=	.1174
Buses					
HDBS	=	0.0020			
HDBT	=	0.0009			
Total	=	0.0029			

Using the methodology described in Section 4.1.5 in Technical Guidance on the Use of MOBILE6.2 for Emission Inventory Preparation the new 2007 North Carolina statewide mix was developed. The basic formula for developing the mix is shown below,

$$\text{Vehicle Type} = (\text{2007 M6.2 fraction for vehicle}) \times \frac{(\text{2007 State total for group})}{(\text{2007 M6.2 total for subcategory})}$$

Table 4.2.4-2 displays the calculation for each vehicle type for the 2007 rural interstate vehicle mix.

Table 4.2.4-2 Calculation of New 2007 Statewide Rural Interstate Vehicle Mix

Vehicle Type		Calculation		New 2007 Mix
LDV	=	LDV	=	0.5900
MC	=	MC	=	0.0037
Light Duty Trucks				
LDT1	=	$0.0822 \times (0.1337/0.4788)$	=	0.0230
LDT2	=	$0.2735 \times (0.1337/0.4788)$	=	0.0764
LDT3	=	$0.0843 \times (0.1337/0.4788)$	=	0.0235
LDT4	=	$0.0388 \times (0.1337/0.4788)$	=	0.0108
Heavy Duty Vehicles				
HDV2B	=	$0.0387 \times (0.2616/0.1174)$	=	0.0862
HDV3	=	$0.0038 \times (0.2616/0.1174)$	=	0.0085
HDV4	=	$0.0031 \times (0.2616/0.1174)$	=	0.0069
HDV5	=	$0.0023 \times (0.2616/0.1174)$	=	0.0051
HDV6	=	$0.0086 \times (0.2616/0.1174)$	=	0.0192
HDV7	=	$0.0102 \times (0.2616/0.1174)$	=	0.0227
HDV8A	=	$0.0111 \times (0.2616/0.1174)$	=	0.0247
HDV8B	=	$0.0396 \times (0.2616/0.1174)$	=	0.0882
Buses				
HDBS	=	$0.0020 \times (0.0110/0.0029)$	=	0.0076
HDBT	=	$0.0009 \times (0.0110/0.0029)$	=	0.0034

2008, 2011, 2014, 2017 and 2021 Statewide Vehicle Mix

Once the 2007 vehicle mix was generated, the other years were created using the methodology described in Section 4.1.4 in Technical Guidance on the Use of MOBILE6.2 for Emission Inventory Preparation. This method grouped light duty vehicles, light duty trucks and motorcycles together and heavy duty buses, heavy duty trucks and heavy duty vehicles together. The combined percentages for these groupings are listed below.

Light Duty Vehicles = 72.74%

Heavy Duty Vehicles = 27.26%

The MOBILE6.2 vehicle mix fractions for the year being developed were obtained from Table 4.1.2 in Technical Guidance on the Use of MOBILE6.2 for Emission Inventory Preparation. The MOBILE6.2 vehicle fractions for 2008 are listed below.

Light Duty Vehicles			Heavy Duty Vehicles		
LDV	=	0.3807	HDV2B	=	0.0388
LDT1	=	0.0846	HDV3	=	0.0038
LDT2	=	0.2817	HDV4	=	0.0031
LDT3	=	0.0868	HDV5	=	0.0024
LDT4	=	0.0399	HDV6	=	0.0087
MC	=	0.0055	HDV7	=	0.0102
Total	=	0.8792	HDV8A	=	0.0111
			HDV8B	=	0.0397
			HDBS	=	0.0020
			HDBT	=	0.0009
			Total	=	.1207

The North Carolina 2008 vehicle mix was normalized to the MOBILE6.2 fractions using the following formula:

$$\text{Vehicle Type} = (\text{2008 M6 fraction for vehicle}) \times \frac{(\text{2007 State total for group})}{(\text{2008 M6 total for group})}$$

Table 4.2.4-3 below displays the calculations used to generate the 2008 North Carolina vehicle mix for rural interstate.

Table 4.2.4-3 Calculation of 2008 Statewide Rural Interstate Vehicle Mix

Vehicle Type		Calculation		2008 State Mix
Light Duty Vehicles				
LDV	=	$0.3807 \times (0.7274/0.8792)$	=	0.3151
LDT1	=	$0.0846 \times (0.7274/0.8792)$	=	0.0700
LDT2	=	$0.2817 \times (0.7274/0.8792)$	=	0.2331
LDT3	=	$0.0868 \times (0.7274/0.8792)$	=	0.0718
LDT4	=	$0.0399 \times (0.7274/0.8792)$	=	0.0330
MC	=	$0.0055 \times (0.7274/0.8792)$		0.0046
Heavy Duty Vehicles				
HDV2B	=	$0.0388 \times (0.2726/0.1207)$	=	0.0876
HDV3	=	$0.0038 \times (0.2726/0.1207)$	=	0.0086
HDV4	=	$0.0031 \times (0.2726/0.1207)$	=	0.0070
HDV5	=	$0.0024 \times (0.2726/0.1207)$	=	0.0054
HDV6	=	$0.0087 \times (0.2726/0.1207)$	=	0.0196
HDV7	=	$0.0102 \times (0.2726/0.1207)$	=	0.0230
HDV8A	=	$0.0111 \times (0.2726/0.1207)$	=	0.0251
HDV8B	=	$0.0397 \times (0.2726/0.1207)$	=	0.0896
HDBS	=	$0.0020 \times (0.2726/0.1207)$	=	0.0045
HDBT	=	$0.0009 \times (0.2726/0.1207)$	=	0.0020

This method was used to generate all of the future year vehicle mixes that were needed to compute the emission factors. The North Carolina transportation partners consider the statewide vehicle mix to be the best representation of the vehicle population in the Hickory and Triad nonattainment areas. The vehicle mixes for all years can be found in Section 5.3 of this appendix.

4.2.5 Temperature, Relative Humidity and Barometric Pressure Assumptions

The MOBILE6.2 command “HOURLY TEMPERATURES” was used to enter 24 hourly temperatures to estimate mobile source emissions. This command requires the command name followed by the 24 hourly temperatures in the data field in the RUN SECTION of the mobile input files. The temperatures must be listed beginning with the 6 a.m. and continuing through 5 a.m. the next day. The first 12 values must be on the same line as the command; the remaining twelve must be on the next line. For mobile source emission estimates, the NCDAQ used 2002

quarterly averages for the 24-hour temperature profile from the Hickory Airport for Catawba County and the Triad Regional Airport for Davidson and Guilford Counties. Data were obtained by the NCDAQ meteorologists from North Carolina State Climate Retrieval and Observations Network of the Southeast Database (CRONOS).

The MOBILE6.2 command “RELATIVE HUMIDITY” was used to enter 24 hourly relative humidity values to estimate mobile source emissions. This command requires the 24 hourly values be in the same format as the HOURLY TEMPERATURES command. The relative humidity values are entered in the SCENARIO section of the mobile input files. Just as the temperatures, the relative humidity data represents a 2002 quarterly average profile from the corresponding airports. When the RELATIVE HUMIDITY command is used, the user supplied relative humidity values are converted to absolute humidity. This conversion requires values of temperature and barometric pressure.

The BAROMETRIC PRES command allows the user to change the default value of barometric pressure used in the humidity conversion. A pressure of 30.0 inches of mercury is used in the exercise.

The temperature profiles as presented in the MOBILE6.2 input files are listed below for each quarter.

Catawba County

First Quarter	37.8 36.8 37.2 40.6 44.1 47.8 50.3 52.6 53.8 54.7 54.8 54.0
	51.5 49.3 47.8 46.4 44.8 44.1 42.8 41.5 40.5 40.2 39.6 38.6
Second Quarter	58.3 60.5 63.7 67.1 69.6 72.3 73.7 75.6 75.8 76.6 76.6 75.7
	74.3 72.0 69.6 67.6 65.7 64.5 63.8 62.2 61.2 60.4 59.4 58.5
Third Quarter	66.8 67.9 70.5 73.7 76.6 78.7 80.9 81.2 82.1 82.5 82.3 81.3

4.2.6 Vehicle Inspection and Maintenance Program Assumptions

In 2002, North Carolina implemented a new vehicle emissions inspection program referred to as onboard diagnostics (OBDII). This program covers all light duty gasoline powered vehicles that are model year 1996 and newer. The program was initially implemented in 9 counties and was expanded to include a total of 48 counties between July 2002 and January 2006. Guilford County was phased in July 2002. Davidson and Catawba Counties were phased-in July 1, 2003. The OBDII compliance rate used in the mobile source emission estimates is 95 percent. In addition, the inspection stations are required to administer an anti-tampering check to ensure that emissions control equipment on any vehicle 35 years old and newer has not been altered.

4.2.7 Reid Vapor Pressure (RVP) Assumptions

RVP reflects a gasoline's volatility. During the winter months an RVP of 14.0 pounds per square inch (psi) is allowable. As ambient air temperatures increase, so does the volatility of gasoline. Lower RVP leads to lower volatile organic compounds (VOC) emissions from gasoline handling and lowers vapor losses from motor vehicles. An RVP of 9.0 psi is required during May through September for Catawba County. An RVP of 9.0 psi is required for Davidson and Guilford Counties in May, but further reduces to an RVP of 7.8 psi for June through September. MOBILE6.2 was run quarterly to account for the ambient temperature's

effect on NO_x emissions. An average RVP was used for each quarter based on specific county requirements. Table 4.2.7-1 lists the RVPs used for each county.

Table 4.2.7-1 RVP per quarter in psi

	Q1	Q2	Q3	Q4
Catawba	14.0	10.5	9.0	14.0
Guilford	14.0	10.1	7.8	14.0
Davidson	14.0	10.1	7.8	14.0

4.2.8 Diesel Sulfur Content Assumptions

The diesel fuel sulfur content is required in MOBILE6.2 to generate PM_{2.5} emission factors because the amount of sulfur in diesel fuel directly correlates to sulfate particulate emissions. For the MVEBs calculation, the USEPA recommends a diesel fuel sulfur content of 43 parts per million (ppm) for the period June 2006-May 2010 and 11 ppm for June 2010 -2015, for all of the nonattainment counties. These values come from Section 5.5 in Technical Guidance on the Use of MOBILE6.2 for Emission Inventory Preparation. The USEPA's Office of Transportation and Air Quality (OTAQ) was contacted at the time of this submission to verify that there was no update to this guidance.

4.3 VMT Assumptions

In order to calculate emissions from on-road mobile sources, emission factors are developed as discussed throughout this document. The emission factors are then multiplied by an activity level, which for on-road mobile sources is daily VMT. The modeled and non-modeled VMT for the Triad nonattainment area was provided by PART on February 11, 2009 for the years 2008, 2011, 2014, 2017, and in September 2009 for the year 2021. The non-modeled VMT for the Hickory nonattainment area was provided by NCDOT in September 2009 for the years 2008, 2011, 2015, 2020, and 2025, which were interpolated to the required years. The modeled VMT for Catawba County were received for the years 2007, 2015, 2020, and 2025 and interpolated to the years needed. Tables 4.3-1 through 4.3-5 list the VMT used in the MVEBs calculations.

Table 4.3-1 Modeled Vehicle Miles Traveled for Davidson County

Functional Class	2008	2011	2014	2017	2021

4.4 Off Model Calculations

Not all 100 counties in North Carolina have a motor vehicle emission inspection and maintenance (I/M) program to address mobile emissions. As a direct result, such a control measure must be evaluated based on commuting activities to account for the vehicles that are not subject to such a program traveling throughout the nonattainment area. A methodology was developed using accident data that is tracked by the NCDOT as a surrogate for commuting patterns. The accident data used in this analysis is for 2007. This methodology was approved by the USEPA and will be used in this analysis.

All Hickory and Triad nonattainment area counties were phased into the North Carolina emission inspection program by 2007, so the 2008, 2011, 2014, 2017, and 2021 runs will have the same I/M fraction. Table 4.4-1 summarizes the I/M fractions used to calculate the tons per year emissions for each of the counties being analyzed.

Table 4.4-1 I/M Fractions

County	2008, 2011, 2014, 2017 and 2021
Davidson	0.94
Guilford	0.94
Catawba	0.91

The calculation of tons per day is as follows:

$$\text{Emissions} = \frac{[\text{I/M EF} \times \text{I/M fraction} \times \text{VMT}] + [\text{Non I/M EF} \times \text{I/M fraction} \times \text{VMT}]}{C}$$

Where:

- I/M EF = all vehicle emission factor from MOBILE6.2 inspection and maintenance run output for each road type (grams/mile)
- I/M fraction = calculated I/M fraction for the analysis year
- VMT = daily vehicle miles traveled (miles/day)
- Non I/M EF = all vehicle emission factor from MOBILE6.2 non-inspection and maintenance output for each road type
- C = conversion factor from grams to tons = 907185 grams per ton

The tons per day emissions for each quarter are then multiplied by the number of days in the quarter. The quarterly emissions are then summed to the annual emissions.

4.5 Estimated Emissions From Mobile Sources

Each road type will have different emissions, which is then summed for each county for each year evaluated. A summary of emissions in tons per year, by county, is provided in Tables 4.5-1, 4.5-2 and 4.5-3 for NO_x, PM_{2.5}, and SO₂ emissions, respectively.

4.6 Motor Vehicle Emissions Budget for Conformity

4.6.1 Transportation Conformity

The purpose of transportation conformity is to ensure that Federal transportation actions occurring in a nonattainment area do not hinder the area from attaining and/or maintaining the annual PM_{2.5} standard. This means that the level of emissions estimated by the NCDOT or the MPOs for the Transportation Improvement Program and Long Range Transportation Plan must not exceed the MVEBs as defined in this maintenance plan.

4.6.2 Pollutants to be Considered

40 CFR 93.119(f)(7) through (10) identifies the pollutants for PM_{2.5} that regional emissions analysis needs to be performed for transportation conformity purposes. These parts of the rule are listed below:

§119(f)(7) – PM_{2.5} in PM_{2.5} areas;

§119(f)(8) – Reentrained road dust in PM_{2.5} areas only if the EPA [Environmental Protection Agency] Regional Administrator or the director of the State air agency has made a finding that emissions from reentrained road dust within the area are a significant contributor to the PM_{2.5} nonattainment problem and has so notified the MPO and DOT [Department of Transportation];

§119(f)(9) – NO_x [nitrogen oxides] in PM_{2.5} areas, unless the EPA Regional Administrator and the director of the State air agency have made a finding that emissions of NO_x from within the area are not a significant contributor to the PM_{2.5} nonattainment problem and has so notified the MPO and DOT; and

§119(f)(10) – VOC, SO₂ and/or ammonia in PM_{2.5} areas if the EPA Regional Administrator or the director of the State air agency has made a finding that any of such precursor emissions from within the area are a significant contributor to the PM_{2.5} nonattainment problem and has so notified the MPO and DOT.

Only primary, or direct PM_{2.5}, tailpipe emissions must be considered for transportation conformity regional emissions analysis. The other precursor pollutants and reentrained road dust only need to be considered if the State air agency and/or the USEPA has deemed the pollutant as a significant contributor to the PM_{2.5} nonattainment problem. The following sections discuss the significance of the precursor pollutants and reentrained road dust to the PM_{2.5} nonattainment problem.

Precursor Pollutants NO_x, VOC, and Ammonia

The PM_{2.5} precursor NO_x is presumed to be a significant contributor to the PM_{2.5} nonattainment problem by the USEPA. The NCDAQ has determined that NO_x is a relatively minor contributor to the PM_{2.5} concentrations in North Carolina. However, the NCDAQ is not asserting that NO_x is an insignificant precursor for the 1997 PM_{2.5} standard. Therefore, the NCDAQ will establish county level MVEBs for NO_x for all three PM_{2.5} nonattainment counties.

For the purpose of this attainment demonstration, VOC and ammonia are presumed to be insignificant contributors to the PM_{2.5} nonattainment problem by the USEPA. The NCDAQ agrees with the USEPA that both VOC and ammonia are insignificant contributors to the PM_{2.5} nonattainment problem in North Carolina. Since these precursors have been deemed insignificant, no MVEBs are being established for VOC or ammonia.

An affirmative insignificance finding from the USEPA only relieves the transportation partners from a regional emissions analysis for PM_{2.5} emissions for these areas and does not relieve them of the other transportation conformity requirements. The transportation partners will need to note the PM_{2.5} insignificance finding (if found adequate and approved by the USEPA) in future conformity determinations.

Reentrained Road Dust

The majority of the roads in North Carolina are paved so there is minimum road dust due to the paved roads. The factor to calculate reentrained road dust on paved roads is very small. What dust is generated, has been shown in the literature, *Methodology to Estimate the Transportable Fraction (TF) of Fugitive Dust Emissions for Regional and Urban Scale Air Quality Analyses*, *US EPA, August 3, 2005*, to be inconsequential.

This fact is affirmed by the small crustal component in the PM_{2.5} speciated data which measures only 3% at Hickory monitoring site (Catawba County) in 2002 and only 2% at Lexington monitoring site (Davidson County) in 2004 (see Figure 4.6.2-1 below).

Figure 4.6.2-1. Speciated Data for the Hickory area (left) and the Triad area (right)

Since the reentrained road dust is not a significant contributor to the PM_{2.5} nonattainment problem, the NCDAQ will not be establishing MVEBs for this source category. An affirmative insignificance finding from the USEPA only relieves the transportation partners from a regional emissions analysis for reentrained road dust emissions for these areas and does not relieve them of the other transportation conformity requirements. The transportation partners will need to note the reentrained road dust insignificance finding (if found adequate and approved by the USEPA) in future conformity determinations.

Precursor Pollutant SO₂

The PM_{2.5} precursor SO₂ could not be deemed insignificant to the PM_{2.5} nonattainment problem. However, the NCDAQ has determined that SO₂ emitted by the mobile source sector is insignificant. The USEPA in its Federal Register notice for PM_{2.5} does not address the mobile sector in its listing of significant emissions. North Carolina agrees with the following statements addressing SO₂ from on-road mobile emissions as published in the May 6, 2005 Federal Register, (70 FR 24283):

“While speciated air quality data show that sulfate is a relatively significant component (e.g., ranging from nine to 40 percent) of PM_{2.5} mass in all regions of the country, emissions inventory data and projections show that on-road emissions of SO_x constitute a “de minimis” (i.e., extremely small) portion of total SO_x emissions. Emissions inventory data for 1999 for the 372 potential PM_{2.5} nonattainment counties for PM_{2.5} (based on 1999–2001 air quality data) show that on-road sources were responsible for only two percent of total SO_x emissions.

Furthermore, EPA has already adopted two regulations that will greatly reduce emissions of SO_x from on-road sources by the time such regulations are both in full effect in 2009. First, in 2004 the low sulfur gasoline program began to be phased in and will be fully effective in 2007 (February 10, 2000, 65 FR 6697). This regulation will reduce the sulfur content of gasoline by approximately 90 percent when fully effective. Second, in 2006 the low sulfur diesel program will begin to be phased in and will be fully effective by 2009 (January 18, 2001, 66 FR 5001). This regulation will reduce the sulfur content of diesel fuel by approximately 97 percent nationally when fully effective.

Projections of on-road emissions of SO₂ in 2020 indicate that on-road sources will be responsible for less than one percent of the total SO₂ emissions in 2020 in the 372 potential PM_{2.5} nonattainment counties (based on 1999–2001 air quality data). These projections confirm that the implementation of the fuel regulations discussed above will ensure that as a general matter of SO₂ emissions from on-road sources remain at insignificant levels in all areas.”

Although sulfate is a significant component to the PM_{2.5} nonattainment problem in North Carolina, the majority of the SO₂ emissions (which can be oxidized to form sulfates) in 2009 come from the stationary point source sector (see Figure 4.6.2-2). The mobile source sector only contributes one half of one percent (0.5 %) of the 2009 statewide SO₂ emissions. This is consistent with what the USEPA stated above.

Figure 4.6.2-2. North Carolina's 2009 Statewide SO₂ Emissions

Since the mobile source SO₂ contribution is insignificant, the NCDAQ is not establishing MVEBs for this precursor. An affirmative insignificance finding from the USEPA only relieves the transportation partners from a regional emissions analysis for SO₂ emissions for these areas and does not relieve them of the other transportation conformity requirements. The transportation partners will need to note the SO₂ insignificance finding (if found adequate and approved by the USEPA) in future conformity determinations.

Direct PM_{2.5} Emissions

40 CFR 93.109(k) in the Transportation Conformity Rule Amendments for the new 8-hour ozone and fine particulate matter National Ambient Air Quality Standards (NAAQSs) addresses areas with insignificant motor vehicle emissions as follows,

“Notwithstanding the other paragraphs in this section, an area is not required to satisfy a regional emissions analysis for §93.118 and/or §93.119 for a given pollutant/precursor and NAAQS, if EPA finds through the adequacy or approval process that a SIP demonstrates that regional motor vehicle emissions are an insignificant contributor to the air quality problem for that pollutant/precursor and NAAQS. The SIP would have to demonstrate that it would be unreasonable to expect that such an area would experience enough motor vehicle emissions growth in that pollutant/precursor for a NAAQS violation to occur.”

The rule suggests that such a finding would be based on a number of factors, including the percentage of motor vehicle emissions in the context of the total SIP inventory, the current state of air quality as determined by monitoring data for that NAAQS, the absence of SIP motor

vehicle control measures, and historical trends and future projections of the growth of motor vehicle emissions. Although there is an inspection and maintenance program in the nonattainment areas, this control measure does not control primary PM_{2.5}, but rather is in place to reduce the ozone precursors.

The NCDAQ believes strongly that the primary PM_{2.5} emissions from mobile sources do not contribute significantly to the PM_{2.5} nonattainment problem. However, the USEPA has indicated they will not approve a SIP that does not set MVEBs for primary PM_{2.5} for the Triad nonattainment area. Therefore, the NCDAQ will establish county level MVEBs for primary PM_{2.5} for this area. The sections that follow discuss the insignificance of PM_{2.5} emissions for the Hickory nonattainment area.

The attainment modeling for the Hickory and the Triad PM_{2.5} nonattainment areas was submitted to the USEPA on August 21, 2009. In conjunction with that modeling, the NCDAQ examined the sources of PM_{2.5} emissions and their contribution to PM_{2.5} formation in the nonattainment counties. This was accomplished using the 2009 emissions inventories developed for the attainment demonstration modeling. Figure 4.6.2-3 provides the percent contributions from point, area, nonroad mobile and on-road mobile source sectors for the Hickory nonattainment area.

Figure 4.6.2-3. Hickory Area 2009 Primary PM_{2.5} Emissions

The 2009 on-road mobile PM_{2.5} emissions contributed only 1.6% of the total PM_{2.5} emissions for the Hickory area. Therefore, it is demonstrated that the PM_{2.5} emissions compared to the total

PM_{2.5} emissions are insignificant. It should be noted that the mobile source PM_{2.5} emissions slightly decrease from 2002 to 2009 despite an increase in VMT. The Hickory PM_{2.5} emissions go from 100 tons/year in 2002 to 75 tons/year in 2009. Meanwhile, there is an increase in VMT in the Hickory area from 4,444,280 miles/day in 2002 to 5,081,590 miles/day in 2009. Further justification for the case insignificance of direct PM_{2.5} emission follows.

The NCDAQ performed sensitivity modeling using 2008 emissions modeling in order to address the challenge of Section 93.109(k) in the Transportation Conformity Rule Amendments, “*The SIP would have to demonstrate that it would be unreasonable to expect enough motor vehicle emissions growth in that pollutant/precursor for a NAAQS violation to occur*”. The modeling system used was the same as the VISTAS/ASIP modeling and consisted of three components: 1) the Penn State University/National Center for Atmospheric Research Mesoscale Model (MM5 version 3.6.1+), 2) the Sparse Matrix Operator Kernel Emissions Modeling System (SMOKE version 2.1), and 3) the Community Multiscale Air Quality (CMAQ version 4.4) model. Model configurations, input data, and modeling methods are consistent with those suggested by the USEPA in Guidance on the Use of Models and Other Analyses in Attainment Demonstrations for the 8-hour Ozone NAAQS.

The primary PM_{2.5} emissions from on-road mobile sources were doubled in Catawba, Davidson and Guilford Counties, therefore, simulating a doubling of the VMT during a 7-day summer time simulation. The results of the emissions sensitivities showed such similar results that looking at just the difference between two air quality model simulations, one with base case emissions and another with increased emissions inputs, no change in air quality concentrations could be discerned. To show what the differences were between the two runs, line graphs of the hourly emissions for the time period modeled for Catawba County is displayed in Figures 4.6.2-3. The sensitivity modeling design value (DV) increased by 0.04 µg/m³ in Catawba County. The difference is barely visible as seen in the figure below.

Figure 4.6.2-4. Catawba County Hourly PM_{2.5} Emissions

Based on the information discussed above, the NCDAQ believes that the on-road mobile PM_{2.5} emissions are insignificant contributors to the PM_{2.5} nonattainment problem. Emission estimates indicate that the on-road mobile PM_{2.5} emissions are a small percentage of the total PM_{2.5} emissions in the Hickory nonattainment area. On-road mobile PM_{2.5} emissions are projected to decrease into the future notwithstanding VMT increases. Air quality modeling sensitivities show that doubling the mobile source PM_{2.5} emissions has very little effect on the future design values. The NCDAQ considers it unreasonable to expect that the Hickory PM_{2.5} nonattainment area will experience enough motor vehicle PM_{2.5} emissions growth for a future PM_{2.5} violation to occur due to mobile sources.

Due to above analysis and agreement from the USEPA, budgets for direct PM_{2.5} will not be set for the Hickory nonattainment area. An affirmative insignificance finding from the USEPA only relieves the transportation partners from a regional emissions analysis for PM_{2.5} emissions for this area and does not relieve them of the other transportation conformity requirements. The transportation partners will need to note the PM_{2.5} insignificance finding (if found adequate and approved by the USEPA) in future conformity determinations.

4.6.3 Safety Margin

A safety margin is the difference between the attainment level of emissions from all source categories (i.e., point, area, and mobile) and the projected level of emissions from all source

categories. The State may choose to allocate some of the safety margin to the MVEBs, for transportation conformity purposes, so long as the total level of emissions from all source categories remains below the attainment level of emissions. In this redesignation, the safety margin is the difference between the attainment level of emissions (2008) from all man-made sources and the projected level of emissions from all man-made sources in the nonattainment area. The safety margin for each projected year is listed below in Table 4.6.3-1 and 4.6.3-2.

Table 4.6.3-1 Safety Margin for Hickory PM_{2.5} Nonattainment Area

Year	NOx		PM _{2.5}	
	(tons/year)	(kilograms per year)	(tons/year)	(kilograms per year)
2011	-4,685	-4,250,162	-39	-35,380
2014	-5,679	-5,151,904	-84	-76,204
2017	-6,411	-5,815,963	-123	-111,584
2021	-7,023	-6,371,160	-167	-151,500

Table 4.6.3-2 Safety Margin for Triad PM_{2.5} Nonattainment Area

Year	NOx		PM _{2.5}	
	(tons/year)	(kilograms per year)	(tons/year)	(kilograms per year)
2011	-4,141	-3,756,653	-107	-97,069
2014	-7,795	-7,071,507	-218	-197,766
2017	-10,532	-9,554,472	-317	-287,578
2021	-12,717	-11,536,672	-413	-374,667

There are significant safety margins for both nonattainment areas for 2011 and 2021. The NCDAQ has decided to allocate a portion of the safety margin to the MVEBs to allow for unanticipated growth in VMT, changes to vehicle mix assumptions, etc. that will influence the emission estimations. However, since NOx is a precursor to ozone, the NCDAQ has decided to limit how much safety margin is added to the NOx MVEBs. In 2008 the USEPA lowered the National Ambient Air Quality Standard for ozone to 0.075 ppm. The NCDAQ believes adding an additional 10% to the 2011 NOx emissions is appropriate for the 2011 NOx MVEBs and adding an additional 20% to the 2021 NOx emissions is appropriate for the 2021 NOx MVEBs to account for potential changes in VMT, vehicle mix and vehicle age distribution for Catawba, Davidson, and Guilford Counties. This is consistent with how the NCDAQ has handled safety margins for NOx MVEBs in ozone maintenance plans. The NCDAQ believes that setting the

2011 and 2021 PM_{2.5} MVEBs to the level of PM_{2.5} emissions present in 2008 is a sufficient safety margin for Davidson and Guilford Counties.

4.6.4 Motor Vehicle Emission Budgets

As part of the consultation process on setting MVEBs, the NCDAQ sent out a request for comment on setting the geographic extent of the MVEBs to all of the transportation partners. A copy of the letter can be found in Appendix B. In the letter, the NCDAQ expressed its preference for setting county level budgets and the reasons why the NCDAQ believed county level budgets were appropriate. With respect to the PM_{2.5} nonattainment areas, the NCDAQ received comments from the Greensboro MPO regarding the geographic extent of the MVEBs. The Greensboro MPO agreed with the NCDAQ that MVEBs should be set at the county level. A copy of the letter received that relate to the PM_{2.5} nonattainment areas can be found in Appendix B. Therefore MVEBs will be set at the county level.

According to Section 93.118 of the transportation conformity rule, a maintenance plan must establish a MVEB for the last year of the maintenance plan (in this case, 2021). Through the interagency consultation process, it was decided that an interim MVEB would be set for the year 2011 for the Hickory and Triad maintenance plan.

Although the emissions are usually expressed in terms of tons, the MVEBs will be set in terms of kilograms (kg). The reason for the change is because the MOBILE6.2 model generates the emissions factors in grams per mile. In past conformity exercises, there have been some issues with conversion to tons, as well as concerns with how the MVEBs were rounded. Setting MVEBs in kilograms will avoid these issues in future conformity determinations. The conversion factor used is 907.185 kilograms per ton.

Tables 4.6.4-1 and 4.6.4-2 below display the PM_{2.5} and NO_x emissions, respectively expressed in kilograms per year and the corresponding tons per year for the years MVEBs are being established. These two tables are for reference purposes only and are not the tables presenting the MVEBs.

Table 4.6.4-1 On-Road Mobile Source PM_{2.5} Emissions

County	Kilograms/year		Tons/year	
	2011	2021	2011	2021
Davidson	47,665	32,394	52.54	35.71
Guilford	128,465	105,716	141.61	116.53
Triad Total	176,130	138,110	194.15	152.24

Table 4.6.4-2 On-Road Mobile Source NO_x Emissions

County	Kilograms/year		Tons/year	
	2011	2021	2011	2021
Catawba	2,567,557	1,082,209	2,830.25	1,192.93
Davidson	2,776,419	1,102,713	3,060.48	1,215.53
Guilford	7,218,360	2,964,834	7,956.88	3,268.17
Triad Total	9,994,779	4,067,547	11,017.36	4,483.70

The NCDAQ will set MVEB, for transportation conformity purposes, as county budgets within the Hickory and Triad maintenance areas for 2011 and 2021. Tables 4.6.4-3 through 4.6.4-5 below list out the MVEBs in kilograms per year, for transportation conformity purposes, by county for the years 2011 and 2021. Upon the USEPA's affirmative adequacy finding for these county level sub-area MVEBs, these MVEBs will become the applicable MVEBs for each county.

Table 4.6.4-3 Catawba County MVEB

	2011	2021
<i>NO_x Emissions (kg/year)</i>		
Base Emissions	2,567,557	1,082,209
Safety Margin Allocated to MVEB	256,756	216,442
NO_x Conformity MVEB	2,824,313	1,298,651

Table 4.6.4-4 Davidson County MVEB

	2011	2020
<i>NO_x Emissions (kg/year)</i>		
Base Emissions	2,776,419	1,102,713
Safety Margin Allocated to MVEB	277,642	220,543
NO_x Conformity MVEB	3,054,061	1,323,256
<i>PM_{2.5} Emissions (kg/year)</i>		
Base Emissions	47,665	32,394
Safety Margin Allocated to MVEB	10,361	25,632
PM_{2.5} Conformity MVEB	58,026	58,026

Table 4.6.4-5 Guilford County MVEB

	2011	2021
<i>NO_x Emissions (kg/year)</i>		
Base Emissions	7,218,360	2,964,834
Safety Margin Allocated to MVEB	721,836	592,967
NO_x Conformity MVEB	7,940,196	3,557,801
<i>PM_{2.5} Emissions (kg/year)</i>		
Base Emissions	128,465	105,716
Safety Margin Allocated to MVEB	26,191	48,940
PM_{2.5} Conformity MVEB	154,656	154,656

Tables 4.6.4-6 and 4.6.4-7 list that portion of the safety margin that was added to the mobile source emissions to develop the MVEBs. These values can be compared to those in Tables 4.6.3-1 and 4.6.3-2 to see that NCDAQ added only a small fraction of that which was available. With these safety margins, it is projected that emissions from all source categories will remain below the attainment level emissions.

Table 4.6.4-6 County Level PM25 MVEB Safety Margin for 2011 and 2021

County	2011 MVEB Safety Margin (Kilograms/year)	2021 MVEB Safety Margin (Kilograms/year)
Triad Total	36,151	74,171

Table 4.6.4-7 County Level NOx MVEB Safety Margin for 2011 and 2021

County	2011 MVEB Safety Margin (Kilograms/year)	2021 MVEB Safety Margin (Kilograms/year)
Catawba	256,756	216,442
Triad Total	999,478	813,510

For the Hickory nonattainment area, a total of 256,756 kg/year (283 tons/year) and 216,442 kg/year (239 tons/year) of the 2011 and 2021 NOx safety margins, respectively, were added to the NOx MVEBs.

For the Triad nonattainment area, a total of 999,478 kg/year (1,102 tons/year) and 813,510 kg/year (897 tons/year) of the 2011 and 2021 NOx safety margins, respectively, were added to the Triad NOx MVEBs. For PM_{2.5}, a total of 36,552 kg/year (40 tons/year) and 74,572 kg/year (82 tons/year) of the 2011 and 2021 PM_{2.5} safety margins, respectively, were added to the Triad PM_{2.5} MVEBs. Tables 4.6.4-8 and 4.6.4-9 reflect the remaining safety margins in tons per year.

Table 4.6.4-8 New Safety Margins for the Hickory PM_{2.5} nonattainment area

Year	NOx (tons/year)	PM _{2.5} (tons/year)
2011	-4,042	-39
2014	-5,679	-84
2017	-6,141	-123
2021	-6,784	-167

 * Urban principle arterial mix and speeds
 M615 Comment: User supplied VMT mix.

M583 Warning:
 The user supplied arterial average speed of 28.0
 will be used for all hours of the day. 100% of VMT
 has been assigned to the arterial/collector roadway
 type for all hours of the day and all vehicle types.

M 48 Warning:
 there are no sales for vehicle class HDGV8b

M111 Warning:
 The input diesel sulfur level of 43.0 ppm exceeds
 the 2007 HDD Rule diesel sulfur limit of 15 ppm.
