Project: One Hour Martinizing Site, DSCA ID 32-0013
1103 W Club Blvd, Durham, NC
Subject: Monthly Update

Hart & Hickman, PC (H&H) is proceeding with implementation of the Remedial Action Plan (RAP) for the One Hour Martinizing site. A brief summary of recently completed activities and upcoming activities is provided below. An updated project calendar is provided in Appendix A.

Monthly Vapor Field Screening

On October 9, 2013, H&H completed a monthly vapor field screening event at the site. The event included measuring total volatile organic compounds (VOCs), methane, carbon dioxide, and oxygen in soil vapor, indoor air, and outdoor ambient air. The primary purpose of the sampling is to confirm methane levels are within acceptable standards. Measurements were collected at the following locations:

- Soil Vapor Monitoring Points: SV-8S, SV-8I, SV-18S, SV-19S, SV-20S, SV-20D, SV-29S, SV-55S, SV-55I
- Excavation Vent Exhaust Pipe
- Sub-Slab Depressurization (SSD) System Exhaust and Indoor Air at 1414 Watts St (Triangle Family Church)
- Ambient, Outdoor Air on Source Property

The field screening data are summarized in the attached Table 1, and the methane readings are shown on the attached Figure 1. Recorded field measurements indicate that methane was detected in the sampled source property soil vapor points (SV-8S, SV-8I, SV-55S and SV-55I) at low levels ranging from 0.1 to 0.8% by volume and two off-source property soil vapor points (SV-20S and SV-20D) at low levels of 0.1% by volume. Very low methane levels (0.1 % by volume) were also detected in the sub-slab depressurization system exhaust at the Triangle Family Church at 1414 Watts St. These methane readings are well within acceptable levels. The monthly methane field readings generally appear to be stable or decreasing over time between January 2013 and October 2013.

Methane was detected in the vapors from the excavation passive exhaust vent at a level of 16.0% by volume. These vapors are exhausted into the atmosphere through the stack installed on the source property where they dissipate into the atmosphere. Ambient air monitoring conducted near ground level in the immediate vicinity of the exhaust vent detected only a low methane level of 0.3% by volume.

VOCs were detected in each of the monitored soil vapor points. The highest VOC concentration was detected in the source property soil vapor point SV-8S (313 ppm) located near the source excavation area. The vapor points will continue to be monitored on a monthly basis to evaluate changes over time. The next monthly field screening event is scheduled for November 13, 2013.

Soil Vapor Sampling

On October 9, 2013, H&H collected soil vapor samples from select locations for laboratory analysis of VOCs. Samples for laboratory analysis were collected from the following locations:

- 1103 West Club Blvd (Source Property): SV-8S, SV-8I, SV-55S, SV-55I
- 1414 Watts St (Triangle Family Church): SV-27S, SV-27D, SV-28D
- 1421 Dollar Ave (Gilligan Residence): SV-19, SV-20S, SV-20D, SV-21S, SV-21D
- 1419 Dollar Ave (Drey Residence): SV-18, SV-29S

The samples were analyzed for the primary constituents of concern at the site, including tetrachloroethylene (PCE), trichloroethylene (TCE), cis-1,2-dichloroethylene (cis-1,2-DCE), trans-1,2,-dichloroethylene (trans-1,2-DCE), and vinyl chloride (VC). The analytical results for the soil vapor samples are summarized in Table 2 and presented on Figure 2. The results for the source property are compared to the Division of Waste Management (DWM) Non-Residential Soil Gas Screening Levels (SGSLs), and the results for the non-source properties to the south and east are compared to the DWM Residential SGSLs.

PCE was detected in each of the soil vapor samples at concentrations ranging from 1,200 $\mu\text{g}/\text{m}^3$ to 27,000,000 $\mu\text{g}/\text{m}^3$. The highest PCE concentrations were detected near the excavation area at source property monitoring points SV-8I (27,000,000 $\mu\text{g}/\text{m}^3$) and SV-55S (3,800,000 $\mu\text{g}/\text{m}^3$) and at adjacent property monitoring points SV-27S/D (2,200,000 $\mu\text{g}/\text{m}^3$ /9,200,000 $\mu\text{g}/\text{m}^3$) and SV-29S (1,900,000 $\mu\text{g}/\text{m}^3$). The PCE concentrations detected on the adjacent properties to the south and east exceed the DWM Residential SGSL of 278 $\mu\text{g}/\text{m}^3$.

PCE degradation products, including TCE, cis-1,2-DCE, trans-1,2-DCE, and VC, were also detected in some of the soil vapor samples. TCE was the most widely detected degradation product with concentrations ranging from 6.0 $\mu\text{g}/\text{m}^3$ to 890 $\mu\text{g}/\text{m}^3$. The highest TCE concentration was detected near the excavation in SV-55S (890 $\mu\text{g}/\text{m}^3$).

In accordance with the RAP, soil vapor samples will be collected for laboratory analysis of VOCs prior to the EHC injection and on a monthly basis for a minimum of three months following completion of the injection. The pre and post-injection soil vapor sampling events will include sampling the following soil vapor monitoring points:

- Source property: SV-8S/I, SV-17, SV-55S/I
- West of the source property: SV-49S/D, SV-50
- South of the source property: SV-27, SV-28
- East of the source property: SV-18, SV-19, SV-20S/D, SV-21S/D, SV-25S/D, SV-29S/D, SV-36S/D, SV-43S/D

As the vapor data are collected, the results will be evaluated to determine if any adjustments are needed to the remedial approach or monitoring plan. The pre-injection soil vapor sampling event is tentatively scheduled for the week of December 16, 2013.

Indoor Air Monitoring

In September 2013, H&H conducted quarterly indoor air monitoring at the three structures adjacent to the source property where vapor mitigation systems are in place (1419 Dollar St, 1421 Dollar St, and 1414 Watts St). On September 15, 2013, H&H collected two 3-hour Summa canister indoor air samples from the Triangle Family Church at 1414 Watts St during the church's Sunday service. H&H collected two Radiello samples from the 1419 Dollar St residence (between 9/17/13 and 10/1/13) and the 1421 Dollar St residence (between 9/4/13 and 9/17/13). The indoor air samples were submitted for laboratory analysis of PCE, TCE, cis-1,2-DCE, trans-1,2-DCE, and VC. The analytical results for the indoor air samples are summarized in Table 3 and presented on Figure 3.

PCE was detected in each of the indoor air samples collected at 1414 Watts St at concentrations of 66 $\mu\text{g}/\text{m}^3$ (1414-Front) and 210 $\mu\text{g}/\text{m}^3$ (1414-Rear). To evaluate the risk associated with the detected indoor air concentrations, H&H evaluated a residential exposure scenario assuming 6 hours per week of exposure time, which is typical of a Triangle Family Church parishioner. As shown in the worksheets provided in Appendix B, the calculated cumulative carcinogenic risk levels are 2.6×10^{-7} and 8.4×10^{-7} and the hazard index levels are 0.059 and 0.19 for the 1414-Front and 1414-Rear samples, respectively. These risk levels are within acceptable levels.

PCE was detected in each of the indoor air samples collected from the residences at 1419 Dollar St (5.1 $\mu\text{g}/\text{m}^3$ and 6.1 $\mu\text{g}/\text{m}^3$) and 1421 Dollar St (7.2 $\mu\text{g}/\text{m}^3$ and 13 $\mu\text{g}/\text{m}^3$). The PCE concentration detected in the basement at 1421 Dollar St (13 $\mu\text{g}/\text{m}^3$) exceeds the DWM Residential Indoor Air Screening Level of 8.34 $\mu\text{g}/\text{m}^3$. H&H calculated the risk associated with the detected indoor air concentrations. As shown in the worksheets in Appendix B, the carcinogenic risk levels are less than 1×10^{-5} and the hazard index levels are less than 1. Thus, the risks associated with the detected indoor air concentrations are within acceptable levels.

The next quarterly indoor air sampling event is planned for December 2013.

Injection of EHC

The RAP includes injection of EHC (a commercial remediation product that contains zero-valent iron and carbon) to treat shallow groundwater impacts at the source property. Based on the August and September 2013 groundwater sampling results, H&H has been working with the

DSCA Program to finalize the EHC injection plan. The injection plan presented in the RAP was designed to target PCE groundwater concentrations of 15 mg/L or greater. The attached Figures 4A and 4B depict the extent of groundwater PCE impacts exceeding 15 mg/L in the shallow and intermediate groundwater zones at the site. H&H is proposing to modify the injection layout proposed in the RAP to target the current extent of PCE impacts exceeding 15 mg/L. As shown in Figures 4A and 4B, the modified injection plan includes 30 shallow injection locations and 14 intermediate injection locations. The shallow injections will target a vertical interval from approximately 22 to 40 ft below ground surface (bgs), and the intermediate injections will target a vertical interval from approximately 45 to 55 ft bgs.

Based on the injection contractor's availability, the EHC injection activities are scheduled to begin the week of January 6, 2013. Pre-injection groundwater and soil gas sampling activities are tentatively scheduled for the week of December 16, 2013. H&H is currently working with the UIC Program to obtain approval of the modified injection plan. As shown in Figure 4A, the shallow injection includes points on the 1414 Watts St property. The DSCA Program is working to obtain permission from the property owner for these injection locations.

Information Session

The DSCA Program is planning to hold a public information session prior to the start of the EHC injection. The meeting will likely be held in early December 2013. The website will be updated once the information session is scheduled.

Notes:

IUR and Rfc concentrations from EPA Regional Screening Level (RSL) Residential Air Table May 2013.

LICR = Lifetime Incremental Cancer Risk

AT = Averaging Time

IUR = Inhalation Unit Rate

Rfc = Reference Concentration

EF = Exposure Frequency

ED = Exposure Duration

ET = Exposure Time
