

**FISHERY MANAGEMENT PLAN UPDATE
WAHOO
AUGUST 2026**

STATUS OF THE FISHERY MANAGEMENT PLAN

Fishery Management Plan History

FMP Documentation:	June 2004	
	Amendment 1	July 2010
	Amendment 2	April 2012
	Amendment 3	August 2014
	Amendment 5	July 2014
	Amendment 6	January 2014
	Amendment 7	January 2016
	Amendment 12	June 2021
	Amendment 10	May 2022
	Amendment 11	February 2024
Comprehensive Review:	None	

The South Atlantic Fishery Management Council (SAFMC), in cooperation with the Mid-Atlantic (MAFMC) and New England (NEFMC) councils, developed a Dolphin/Wahoo Fishery Management Plan (FMP) for the Atlantic in 2004. The SAFMC adopted a precautionary and risk-averse approach to management for the Wahoo fishery to maintain the status quo. The original FMP established no minimum size limit for Wahoo in the Atlantic Exclusive Economic Zone (EEZ); established a commercial trip limit of 500 lb; identified allowable gears in the fishery; and prohibited the use of longline gear to harvest Wahoo in areas closed to the use of such gear for highly migratory species. Amendment 1 (SAFMC 2010) provided spatial information of SAFMC designated Essential Fish Habitat and Habitat Areas of Particular Concern relative to the Dolphin Wahoo fishery. Amendment 2 (SAFMC 2011) established acceptable Biological Catch (ABC), Annual Catch Limits (ACL), Accountability Measures (AM), modified the allocations for both commercial and recreational sectors, and established Annual Catch Targets (ACT) for the recreational sector. Amendment 3 (SAFMC 2014; Federal Register 19490) required federal dealer permits and changed the method and frequency of harvest reporting. In 2013, Amendment 5 (SAFMC 2013) was approved and adopted by the SAFMC and was the most comprehensive amendment to the Dolphin/Wahoo FMP, in terms of process updates. Amendment 5 updated the ACLs and AM for both sectors, as well as the ABC values and ACT for the recreational fishery as a result of improvements to the recreational catch estimation methods used by the Marine Recreational Information Program (MRIP). This amendment also set up an abbreviated framework procedure whereby modifications to the ACLs, ACTs, and AMs can be implemented by the National Oceanic and Atmospheric Administration (NOAA) Fisheries without a full FMP amendment. Amendment 7 (SAFMC 2015) allowed for Dolphin and Wahoo fillets to enter the U.S. EEZ after lawful harvest in the Bahamas.

Amendment 12 was approved by the SAFMC at its September 2020 meeting and became effective June 6, 2021 (SAFMC 2020). Amendment 12 adds Bullet Mackerel and Frigate Mackerel to the Dolphin/Wahoo FMP and designates them as ecosystem component species. Amendment 10 was approved by the SAFMC at its September 2021 meeting and became effective May 2, 2022 (SAFMC 2020). Amendment 10 includes actions that accommodate updated recreational data from the MRIP by revising the annual catch limits and sector allocations for Dolphin and Wahoo. The amendment also contains actions that implement other management changes in the fishery including revising accountability measures, accommodating possession of Dolphin and Wahoo on vessels with certain unauthorized gears onboard, removing the operator card requirement, and reducing the bag limit/recreational vessel limit for Dolphin and Wahoo. Amendment 11 was approved by the SAFMC at its December 2023 meeting and became effective February 2024 (SAFMC

2023). Amendment 11 is included in the Comprehensive Acceptable Biological Catch Control Rule Amendment which modifies the Acceptable Biological Catch (ABC) Control Rule to address scientific uncertainty, management risk, and rebuilding stocks. Amendment 11 specifies criteria and procedures for phase-in of ABC changes and carry-over of unused portions of annual catch limits.

There are multiple amendments currently under development by the SAFMC. Amendment 4 is included in the Joint Commercial Electronic Logbook Reporting Amendment and modifies reporting requirements for commercial logbooks in Dolphin and Wahoo fisheries. Amendments 13 and 14 are included in the Comprehensive Recreational For-Hire Limited Entry Amendment, which establishes limited entry for the for-hire components and improves for-hire reporting requirements in Dolphin and Wahoo fisheries.

To ensure compliance with interstate requirements, North Carolina also manages this species under the North Carolina Fishery Management Plan for Interjurisdictional Fisheries (IJ FMP). The goal of the IJ FMP is to adopt fishery management plans, consistent with N.C. law, approved by the Mid-Atlantic Fishery Management Council, South Atlantic Fishery Management Council, or the ASMFC by reference and implement corresponding fishery regulations in North Carolina to provide compliance or compatibility with approved fishery management plans and amendments, now and in the future. The goal of these plans, established under the Magnuson-Stevens Fishery Conservation and Management Act (federal council plans) and the Atlantic Coastal Fisheries Cooperative Management Act (ASMFC plans) are like the goals of the Fisheries Reform Act of 1997 to “ensure long-term viability” of these fisheries (NCDMF 2022).

Management Unit

The management unit is the population of Wahoo (*Acanthocybium solandri*) from the U.S. South Atlantic, the Mid-Atlantic, and the New England coasts in the 3- to 200-mi EEZ.

Goal and Objectives

The goal of the plan is to maintain the current harvest levels of Wahoo and ensure that no new fisheries develop (SAFMC 2003). To achieve these goals, the following management objectives were identified:

- Address localized reduction in fish abundance. The councils remain concerned over the potential shift of effort by longline vessels to traditional recreational fishing grounds and the resulting reduction in local availability if commercial harvest intensifies.
- Minimize market disruption. Commercial markets (mainly local) may be disrupted if large quantities of Dolphin are landed from intense commercial harvest or unregulated catch and landing by charter or other components of the recreational sector.
- Minimize conflict and/or competition between recreational and commercial user groups. If commercial longlining effort increases, either directing on Dolphin and Wahoo or targeting these species as a significant bycatch, conflict and/or competition may arise if effort shifts to areas traditionally used by recreational fishermen.
- Optimize the social and economic benefits of the Dolphin and Wahoo fishery. Given the significant importance of Dolphin and Wahoo to the recreational sector throughout the range of these species and management unit, manage the resources to achieve optimum yield on a continuing basis.
- Reduce bycatch of the Dolphin fishery. Bycatch is a problem in the pelagic longline fishery for highly migratory species. Any increase in overall effort, and more specifically shifts of effort into nearer shore, non-traditional fishing grounds by swordfish and tuna vessels, may result in increased bycatch of non-target species. In addition, National Standard 9 requires that: “Conservation and management measures shall, to the extent practicable, (a) minimize bycatch and (b) to the extent bycatch cannot be avoided, minimize the mortality of such bycatch.” Therefore, bycatch of the directed Dolphin fishery must be addressed.

- Direct research to evaluate the role of Dolphin and Wahoo as predator and prey in the pelagic ecosystem.
- Direct research to enhance collection of biological, habitat, social, and economic data on Dolphin and Wahoo stocks and fisheries.

DESCRIPTION OF THE STOCK

Biological Profile

Wahoo is an epipelagic marine species and can be found worldwide in tropical and subtropical waters and extend seasonally into temperate waters. Wahoo are typically solitary but may form small loose aggregations (Collette and Nausen 1983). They gather around floating debris and flotsam, including sargassum, spending most of their time in water less than 200 m in depth, and prefer water temperatures ranging from 17.5°C to 27.5°C (63.5–81.5°F; Theisen and Baldwin 2012). The species is presumed to be short lived (with a possible lifespan of up to or more than 5–6 years; Oxenford et al. 2003); there is much uncertainty in aging Wahoo, and there has been no successful validation of presumed annuli or daily growth checks in otoliths to date. In addition, Wahoo grow rapidly, with fish captured off North Carolina reaching a mean length of 44 in by approximately age-1 (Hogarth 1976). The state record for Wahoo was caught off Ocracoke in 1994 and weighed 150 lb; however, fish landed in North Carolina weigh, on average, approximately 27 lb. Wahoo become sexually mature during their first year, at around 34 in for males and 40 in for females (Hogarth 1976). They are considered batch spawners, meaning they will spawn many times throughout the spawning season, maximizing the survival of larval fish. Spawning occurs offshore of North Carolina around open-ocean currents from June to August, with a peak in June and July (Hogarth 1976).

Stock Status

The stock status of Wahoo in the Western Atlantic is unknown.

Stock Assessment

A stock assessment is not available for this species.

DESCRIPTION OF THE FISHERY

Current Regulations

The North Carolina Division of Marine Fisheries (DMF) currently complements the management measures of the Dolphin/Wahoo FMP through rule (15A NCAC 03M .0517). It is unlawful to possess, for recreational purposes, more than two Wahoo per person per day taken by hook and line. For commercial fishing vessels with a valid Federal Commercial Dolphin/Wahoo Vessel Permit, there is a 500-lb trip limit on Wahoo. Commercial vessels without a valid Federal Commercial Dolphin/Wahoo Vessel Permit are subject to recreational rules and limits for Wahoo and cannot sell their catch.

Commercial Fishery

Commercial landings of Wahoo are reported through the mandatory DMF Trip Ticket program. Landings since 1986 have fluctuated with a low of 4,640 lb in 2025 and a high of 40,731 lb in 1995 (Table 1; Figure 1). In the past 10 years, landings have averaged approximately 15,718 lb; commercial landings in 2025 (4,640 lb) were the lowest in the time series.

ASMFC AND FEDERALLY MANAGED SPECIES – WAHOO

Table 1. Recreational harvest and releases and commercial harvest of Wahoo from North Carolina Marine Recreational Information Program, 1986–2025.

Year	Recreational			Commercial	Total Weight Landed (lb)
	Number Landed	Number Released	Weight Landed (lb)	Weight Landed (lb)

Figure 1. Annual commercial landings reported for Wahoo from the North Carolina Trip Ticket Program, 1986–2025.

Recreational Fishery

Recreational landings of Wahoo are estimated from the MRIP. Recreational estimates across all years have been updated and are now based on the MRIP new Fishing Effort Survey-based calibrated estimates. For more information on MRIP see <https://www.fisheries.noaa.gov/topic/recreational-fishing-data>.

Landings of Wahoo, on average, have decreased in the last 10 years (2016–2025 average of 469,458 lb compared to the 2006–2015 average of 849,514 lb). After peaking in 2004 (2,220,765 lb), Wahoo landings have fluctuated, declining to low of 232,436 lb in 2022 (Table 1; Figure 2). Landings decreased from 406,136 lb in 2024 to 334,799 lb in 2025.

The DMF offers award citations for recreational fishermen who land Wahoo greater than 40 lb. After a period of high, stable number of citations from 2012–2019 (750 citations per year average), the total number of citations awarded through the North Carolina Saltwater Fishing Tournament decreased in 2020 (527 citations), and 2021 (310 citations) before increasing in 2022 (462 citations), then decreasing again in 2023 (388 citations), 2024 (233 citations), and 2025 (143 citations; Figure 3).

Figure 3. Total number of awarded citations for Wahoo (>40 lb landed) annually from the North Carolina Saltwater Fishing Tournament, 1991–2025.

MONITORING PROGRAM DATA

Fishery-Dependent Monitoring

Fishery dependent length-frequency information for the commercial Wahoo fishery in North Carolina is collected by fish house samplers, specifically through DMF programs 438 (Offshore Live Bottom Fishery)

and 439 (Coastal Pelagic). The number of Wahoo samples obtained by fish house samplers is generally low, ranging from 1 to 101 samples each year from 1986 to 2024; this is due to it being an incidental catch in other fisheries. In 2024, 14 Wahoo lengths were obtained, an increase from the previous year (12 samples in 2023) and above the average number of samples (12 samples; Table 2). The average size of Wahoo sampled from the commercial fishery decreased in 2024 (47.1 in fork length (FL)) from the previous year (50.7 in FL) and was below the time series average (49.2 in FL; Table 2). The maximum size of Wahoo sampled from the commercial fishery increased in 2024 (62.2 in FL) from the previous year (61.4 in FL) and was above the time series average (59.3 in FL; Table 2). There were no Wahoo sampled by fish house samplers in 2025 (Table 2).

Length and weight information for the recreational fishery are collected through the MRIP dockside sampling. The average size of Wahoo sampled from the recreational fishery was larger in 2025 (50 in FL) compared to the previous year (45.1 in FL) and overall has remained relatively constant throughout the time series (Table 2). The minimum Wahoo size sampled from the recreational fishery was larger in 2025 (33.9 in FL) from the previous year (5.2 in FL). The maximum Wahoo size sampled from the recreational fishery increased in 2025 (59 in FL) from the previous year (53 in FL in 2024).

Due to no commercial samples, there was no modal length for the commercial fishery in 2025; however, in 2019, the commercial modal length was 44 in FL. The modal length for the Wahoo recreational fishery in 2025 was 55 in FL (Figure 4). On average, the recreational fishery harvests larger maximum sizes of Wahoo than the commercial fishery (Table 2; Figure 5); the average maximum length of Wahoo sampled from the recreational fishery is 67.7 in FL, compared to an average of 59.3 in FL from the commercial fishery. However, on average, the commercial fishery harvests similar size fish (49.2 in FL) to the recreational fishery (47.4 in FL; Table 2).

Figure 4. Recreational length frequency distribution for Wahoo harvested in 2025 from the Marine Recreational Information Program.

ASMFC AND FEDERALLY MANAGED SPECIES – WAHOO

Table 2. Mean, minimum, and maximum lengths (FL, in) of Wahoo collected from the commercial and recreational fisheries through the DMF commercial fish house sampling programs and Marine Recreational Information Program, 1986–2025.

Year	Commercial				Recreational			
	Mean Length	Minimum Length	Maximum Length	Total Number Measured	Mean Length	Minimum Length	Maximum Length	Total Number Measured
1986	51.2	47.6	55.9	3	53.2	31.0	64.0	28

Figure 5. Recreational length frequency of Wahoo harvested from the Marine Recreational Information Program, 1986–2025. Bubbles represent fish at length and the bubble size is proportional to the number of fish at that length.

Fishery-Independent Monitoring

Currently, DMF does not have any fishery-independent sampling programs that target or catch Wahoo in great numbers.

RESEARCH NEEDS

The following are research and management needs as determined by the SAFMC and outlined in the FMPs for pelagic Sargassum habitat and the Dolphin/Wahoo fishery (SAFMC 2002; SAFMC 2003b).

Essential Fish Habitat research needs for Wahoo in order of priority from highest to lowest:

- What is the areal and seasonal abundance of pelagic Sargassum off the southeast U.S.?
- Develop methodologies to remotely assess Sargassum using aerial or satellite technologies (e.g., Synthetic Aperture Radar)
- What is the relative importance of pelagic Sargassum weedlines and oceanic fronts for early life stages of Wahoo?
- Are there differences in Wahoo abundance, growth rate, and mortality?
- What is the age structure of all fishes that utilize pelagic Sargassum habitat as a nursery and how does it compare to the age structure of recruits to pelagic and benthic habitats?
- Is pelagic Sargassum mariculture feasible?
- Determine the species composition and age structure of species associated with pelagic Sargassum when it occurs deeper in the water column.
- Additional research on the dependencies of pelagic Sargassum productivity on the marine species using it as habitat.

ASMFC AND FEDERALLY MANAGED SPECIES – WAHOO

- Quantify the contribution of nutrients to deepwater benthic habitat by pelagic Sargassum.
- Studies should be performed on the abundance, seasonality, life cycle, and reproductive strategies of Sargassum and the role this species plays in the marine environment, not only as an essential fish habitat, but as a unique pelagic algae.
- Research to determine impacts on the Sargassum community, as well as the individual species of this community that are associated with, and/or dependent on, pelagic Sargassum. Human induced (tanker oil discharge; trash) and natural threats (storm events) to Sargassum need to be researched for the purpose of protecting and conserving this natural resource.
- Develop cooperative research partnerships between the Council, NOAA Fisheries Protected Resources Division, and state agencies since many of the needs to (a) research pelagic Sargassum, and (b) protect and conserve pelagic Sargassum habitat, are the same for both managed fish species and listed sea turtles.
- Direct specific research to further address the association between pelagic Sargassum habitat and post-hatchling sea turtles

Biological research needs for Wahoo in order of priority from highest to lowest:

- Additional data are needed to develop and/or improve estimates of growth, fecundity, etc.
- There are limited social and economic data available. Additional data need to be obtained and evaluated to better understand the implications of fishery management options.
- Trophic data should be considered in support of an ecosystem management approach.
- Essential fish habitats for Dolphin and Wahoo need to be identified.
- An overall design should be developed for future tagging work. In addition, existing tagging databases should be examined.
- Establish a list serve for Dolphin and Wahoo which would facilitate research and the exchange of information.

MANAGEMENT

In North Carolina, Wahoo is included in the North Carolina IJ FMP, which defers to management under the SAFMC FMP requirements. The SAFMC approved an FMP for Wahoo in 2004 and it is currently managed under Amendment 5 (SAFMC 2013), Amendment 7 (SAFMC 2015), Amendment 12 (SAFMC 2020), and Amendment 10 (SAFMC 2021).
