

# **An Economic Profile Analysis of Coastal Commercial Fishing Counties in North Carolina**

Stephanie McInerney and John Hadley

North Carolina Department of Environment and Natural Resources  
North Carolina Division of Marine Fisheries  
License and Statistics Section  
Morehead City, NC 28557  
March 2014

This project was conducted under the Atlantic Coastal Fisheries Cooperative Management Act (ACFCMA), and funded by the U.S. Department of Commerce, National Oceanic and Atmospheric Administration, under Grant Award NA08NMF4740476.

## ABSTRACT

In order to develop adequate state fishery management plans, biological, social, and economic data must be used. These data are necessary to develop appropriate management strategies especially when directed at specific species, gears, areas, etc. The goal of this study is to determine economic characteristics of North Carolina's commercial fisheries at a state and county level while providing economic baseline data that may be useful in the development of future state level fisheries management plans.

Variations in North Carolina's commercial landings between 1972 and 2012 can be attributed to several factors including natural variations in fishery stocks, weather events, management strategies, changes in effort, and changes in the socioeconomics of individual fisheries. Landings in North Carolina reached a maximum of 432 million pounds in 1981, and the most profitable year for the state's fisheries occurred in 1995 when landings were valued at \$110 million. Since 1981, commercial landings in North Carolina have been on the decline. In 2012, a total of 22.7 million pounds of finfish valued at \$31 million dollars and 33.9 million pounds of non-fish valued at \$42 million were landed in North Carolina.

The top three finfish species by weight landed in North Carolina from 1994 to 2012 were Atlantic menhaden (47%), Atlantic croaker (11%), and dogfish sharks (5%). The top three finfish by value were summer flounder (16%), southern flounder (14%), and Atlantic croaker (8%). The top non-fish species by weight from 1994 to 2012 were hard blue crabs (79% of the total pounds) and shrimp (14%). Likewise, landings of hard blue crabs and shrimp were the most valuable non-fish species with average values of \$26.7 million and \$14.4 million, respectively.

The gear types contributing the most to the total pounds landed in North Carolina between 1994 and 2012 include pots (31%), purse seines (30%), gill nets (15%), and trawls (15%). Pots, trawls, and gill nets had the highest values in North Carolina but pots and gill nets made up the majority of the trips.

Carteret and Dare counties led all other counties in landings by weight and value between 1994 and 2012. Carteret County accounted for over 38% of the state's total landings while Dare County had the majority of the total value (26%). Carteret County landings averaged around 48.4 million pounds with an average value of \$16.8 million. Dare County averaged around 30.3 million pounds per year with landings valued at an average of \$22.8 million.

Statewide, the commercial fishing-harvesting sector generated 3,473 full-time and part-time jobs and had a total economic impact of \$116 million in 2012. On a county by county basis, the economic impact was not uniform and was greatest in Dare and Carteret counties. Of the counties that did not have confidential landings, the commercial fishing-harvesting sector had the least economic impact in Chowan County, followed by Craven and Pender counties.

## **ACKNOWLEDGEMENTS**

Special thanks to everyone in the NCDMF License and Statistics Section who always work hard to continuously screen and edit data ensuring accurate and reliable analyses. Thanks to Alan Bianchi for his assistance on SAS programs used to analyze data presented in this report and to Al Schmidt for his technical expertise with regards to the FIN database. Many thanks to Christina Wiegand for her work surveying commercial fishermen and helping compile data used to update the NCDMF economic model for this report. Our gratitude also goes out to those who reviewed this report: Don Hesselman, Dan Zapf, Kevin Brown, Laura Lee, Amy Larimer, Tina Moore, Alan Bianchi, Michelle Duval, and Kelly Price.

## DEFINITIONS

Commercial fishing – Fishing in which species harvested, either in whole or in part, are intended to enter commerce through sale, barter, or trade. Since 1999, commercial fishermen in North Carolina are required to have a license issued by the North Carolina Division of Marine Fisheries (NCDMF) and are allowed only to sell to licensed seafood dealers.

Fishing trip – A period of time over which fishing occurs. The time spent fishing includes configuring, deploying, and retrieving gear, clearing animals from the gear, and storing, releasing, or discarding catch. When watercrafts are used, a fishing trip also includes the time spent traveling to and from fishing areas or locales and ends when the vessel offloads product at sea or returns to the shore. When fishing from shore or man-made structures, a fishing trip may include travel between different fishing sites within a 24-hour period.

Nominal ex-vessel price and value – The total landed dollar amount of a given species (or species landing condition and market category). Example: 100 lb of striped mullet at a PRICE of \$0.80 per pound will have a VALUE of \$80. These values represent the average amounts paid to a fisherman by a seafood dealer.

Inflation-adjusted values – Inflation is a general upward price movement of goods and services in an economy, usually as measured by the Consumer Price Index (CPI). Ex-vessel prices and values can be adjusted (deflated) according to the CPI to remove the effects of inflation so that the value of a dollar remains the same across years. Inflation-adjusted values allow for easier understanding and analysis of changes in values.

Active participants - Active participants refer to any fisherman that sold commercial landings to a licensed seafood dealer in a given year.

## INTRODUCTION

North Carolina has 3,375 miles of coastline, encompassing a variety of water bodies that exhibit a wide range of salinities, habitats, and marine species (NOAA 2013). The Outer Banks, a series of barrier islands that stretch along almost 200 miles of the North Carolina coast, begin at the Virginia border and pass through Currituck, Hyde, Dare, and Carteret counties. Cape Hatteras provides a natural divide between Atlantic Ocean waters greatly affected by the cool Labrador Current and the warm Gulf Stream. The interior waters of the state are made up of large sounds, such as the Albemarle Sound, Pamlico Sound, Core Sound, and Bogue Sound. Additionally, North Carolina has several large river systems that feed into the state's coastal waters, including the northern Roanoke and Chowan river systems, the central Pamlico and Neuse river systems, and the southern New and Cape Fear river systems. The extensive and varied waters of coastal North Carolina offer a broad range of fishing opportunities and contribute greatly to the diversity of fisheries found in the state.

North Carolina's commercial fisheries have been subjected to a number of different management strategies over the past twenty years. Many of these strategies have been implemented to avoid overexploitation, to reduce bycatch, or both. Regulations aiming to prevent overexploitation such as quotas, size limits, and bag limits have been developed for many of the commercially important species in North Carolina (NC) such as blue crab (*Callinectes sapidus*), summer flounder (*Paralichthys dentatus*), southern flounder (*P. lethostigma*), hard clams (*Mercenaria mercenaria*), and oysters (*Crassostrea virginica*) among others. Those implemented to reduce bycatch include gear restrictions and area closures such as the gill net measures developed to protect sea turtles in Pamlico Sound and throughout the state following an Incidental Take Permit. However, determining an effective management strategy for a commercial fishery can be a difficult and complicated process and many strategies are often developed without a full understanding of the economic impacts they may have on the fishery's participants (NMFS 1996).

The Fisheries Reform Act of 1997, initiated by the NC General Assembly, requires the development of fishery management plans (FMP) by the North Carolina Division of Marine Fisheries (NCDMF) for all commercially and recreationally important species in NC state waters. The Fisheries Reform Act also requires that biological, social, and economic data be used in order to develop adequate state FMPs. These data are necessary to develop appropriate management options and strategies especially when directed at specific species, gears, areas, etc.

A number of studies have been initiated since 1999 in response to the need for socioeconomic information on North Carolina's fisheries. These studies have included a series of social and economic analyses of the state's commercial fisheries occurring in the Atlantic Ocean, Albemarle Sound, Pamlico Sound, Core Sound, and the southern region of the state from Beaufort Inlet to the South Carolina state line. Results from the most recent studies are used in the division's economic impact model for commercial fishing as well as the socioeconomic sections of all state FMPs (Crosson 2007, 2009, 2010; Hadley and Weigand 2014).

## **GOALS AND OBJECTIVES**

The goal of this study is to determine economic characteristics of North Carolina's commercial fisheries at a state and county level while providing economic baseline data that may be useful in the development of future state level fisheries management plans. Objectives include:

- 1) Describe the economic characteristics of major commercial fisheries for each of North Carolina's coastal fishing counties and;
- 2) Describe the economic relevance of commercial fishing in relation to the overall workforce and economies of North Carolina's coastal counties.

## METHODS

This study encompasses all commercial fishing landings occurring along the coast of North Carolina (Figure 1). All waterbodies, as defined by the NCDMF Trip Ticket Program, were used. These waterbodies include all waters that make up the Albemarle-Pamlico estuarine system, all inshore waters in the southern part of the state, and the Atlantic Ocean.

Figure 1. Map of coastal fishing counties in North Carolina.

Data for this project came from the NCDMF Trip Ticket Program, NCDMF Licenses and Statistics Section, NCDMF Fisheries Economics Program, the United States Census Bureau, the North Carolina Employment Security Commission (NCESC), and the North Carolina State Data Center (LINC).

Data from the NCDMF Trip Ticket Program include commercial fishing landings, ex-vessel value (nominal), as well as the number of trips and participants reporting landings by year, gear, species, and county. Data on license sales were obtained from the NCDMF Licenses and Statistics Section. Licenses that allow fishermen to commercially sell their catch include endorsements to sell, standard commercial fishing licenses (SCFL), retired standard commercial fishing licenses (RSCFL), individual shellfish licenses, menhaden licenses, land or sell licenses, and tournament licenses. These license types were used to determine the number of licenses issued and used by individuals living in each county as well as the number of active fishermen by county of residence. The term “active participant” refers to any fisherman

that sold commercial landings to a licensed seafood dealer. The number of participants claiming to be full-time fishermen was calculated using answers to an economic question in a mandatory survey handed out at the time of renewal or purchase of SCFL, RSCFL, and shellfish licenses. The question asked participants whether or not they derive more than 50% of their income from commercial fishing. Those answering “yes” were considered full-time. Those answering “no” were considered part-time. To determine the number of active participants claiming full-time status, economic survey data were linked to the landings data.

Economic impact estimates of commercial fishing and inflation-adjusted landings for each county were obtained from the NCDMF Fisheries Economics Program. Area estimates by county were obtained from the United States Census Bureau. Data on the income and employment characteristics of coastal counties were obtained from the NCEC Labor Market. Population estimates by year were obtained from the North Carolina State Data Center “Log Into North Carolina” (LINC) website.

All landings data are reported as pounds in whole weight. Landings and value estimates statewide were provided back to 1972 to get a broad overview of commercial fishing in North Carolina over time. Values are reported as nominal and inflation-adjusted and represent ex-vessel value defined as the average annual price of commercial landings received by the fisherman from the seafood dealer multiplied by the amount of landings in pounds. The inflation-adjusted value accounts for changes in inflation by deflating the nominal value back to a base year according to the Consumer Price Index. In this study, inflation-adjusted values are calculated using 1994 as the base year, as detailed value statistics in this report were only reported back to 1994, the start of the Trip Ticket Program.

Analysis of the data includes a breakdown of landings and value by species, gear, and county. Landings by species are focused on species important to North Carolina. These typically include species that are currently under a North Carolina state or federal FMP or species under consideration for a North Carolina state FMP. Species breakdowns by county were limited to the top 10 species to reduce the amount of confidential data. Landings by gear type were determined by using the first gear listed on the trip ticket, which is the primary gear used during any given trip. Up to three gears may be recorded on each paper trip ticket. Electronic dealers can designate a specific gear for each species listed on a trip ticket so all electronic tickets will only have one gear per observation. Analysis of the landings by county focused primarily on the coastal fishing counties and includes a detailed analysis of major species harvested and gears used in each county. For this report, North Carolina has 19 counties considered coastal which include Beaufort, Bertie, Brunswick, Camden, Carteret, Chowan, Craven, Currituck, Dare, Hertford, Hyde, New Hanover, Onslow, Pamlico, Pasquotank, Pender, Perquimans, Tyrrell, and Washington counties.

Trip and participant counts along with landings data are reported for individual species and gear types going back to 1994. Trip and participant counts cannot be determined prior to 1994 because trip level data were not recorded until the Trip Ticket Program was implemented. Dealer counts are based on the number of dealers submitting trip tickets each year and county breakdown is based on physical location of the dealer. Trip and participant counts with regards to landings and value are summarized by county of landing.

For some counties, the landings and value data by year, gear, and/or species were confidential. Data become confidential when there are less than three fishermen, dealers, or vessels reporting landings within any level of data summarization such as by year, gear, species, or county. Confidential landings and value data were replaced with \*\*\* to comply with the NCDMF Confidentiality Policy. In appendix tables broken down by county and gear, if only one gear type was confidential, the non-confidential gear with the lowest pounds was also replaced with \*\*\* to hide the total of the confidential landings. In appendix tables broken down by county and species, "Other Finfish" and "Other Shellfish" species were excluded. Years with blank rows indicate that less than 10 top ten major species were landed in that county. It should also be noted that rounding errors during summarization of these data may cause comparisons between tables and within tables to differ slightly.

The expenditures and income within the commercial fishing industry in North Carolina produce ripple effects in the state's economy. Each dollar spent and earned within the industry generates a more vigorous economy by stimulating additional activity in other industries that fosters jobs, income, and economic output. These impacts are calculated using inputs from the NCDMF economic impact model and IMPLAN Version 3.0, an economic modeling software (IMPLAN 2009).

IMPLAN Version 3.0 is a computerized database and modeling software that uses a regional input-output analysis to estimate economic activity. IMPLAN uses direct industry sales to compute additional secondary economic activities and to estimate economic multipliers as money is spent and re-spent in the regional economy of interest. The secondary economic activities include indirect impacts generated by the purchase of intermediate goods and services used by the direct sale entities and the induced impact from the household expenditures of persons employed in the direct and indirect activities. Economic impacts listed in this report are for the state economy of North Carolina. For example, the economic impact of commercial fishing in Dare County includes impacts to the entire state economy, not just the economy of Dare County.

The percent of the workforce involved in commercial fishing was calculated by taking the total number of fishermen and dividing it by the average annual employment for all industries. The total number of fishermen was determined from Trip Ticket landings and is based on the participant's county of residence. The annual wage per worker by county was obtained from the NCEC. It is important to note here that trends in landings from fishermen for a given county may not be the same as the landings trends for dealers in the same county because fishermen may sell their catch to dealers in other counties and/or dealers may be purchasing from fishermen from multiple counties.

Other important components of the commercial fishing sector include seafood processing and distribution, wholesale, retail markets, and restaurants selling seafood harvested in North Carolina will not be discussed in this report. Limited to no data on these sources are available, specifically for North Carolina. Furthermore, data on seafood trade regarding interstate and intrastate movement of North Carolina seafood products are highly limited due to few reporting requirements to track the movement of seafood and lack of adequate studies that provide data on such material.

## RESULTS

Commercial landings data for NC can fluctuate from year to year for various reasons including ecological changes in the area being fished, social and economic changes in a particular fishery, and/or changes in management strategies. Ecological changes can include alterations in community structure, deterioration or enhancement of habitat and water quality, and weather events such as hurricanes. Social and economic changes can include variations in the market price of a species, user group conflicts, the total amount of effort employed in any particular fishery, and the expense of operating within a specific fishery. Management strategies can affect landings by creating regulations that control effort or harvest in order to maintain viable stocks.

Statewide landings in NC have varied widely from 1972 to 2012 but have been on an overall decline since 1981. Landings reached a maximum of 432 million pounds in 1981; however, the most valuable year occurred in 1995 with landings estimated to be worth \$109 million. In 2012, a total of 22.7 million pounds of finfish valued at \$31 million and 33.9 million pounds of non-fish species valued at \$42 million were landed in NC (Figure 2; Tables A1–A2).

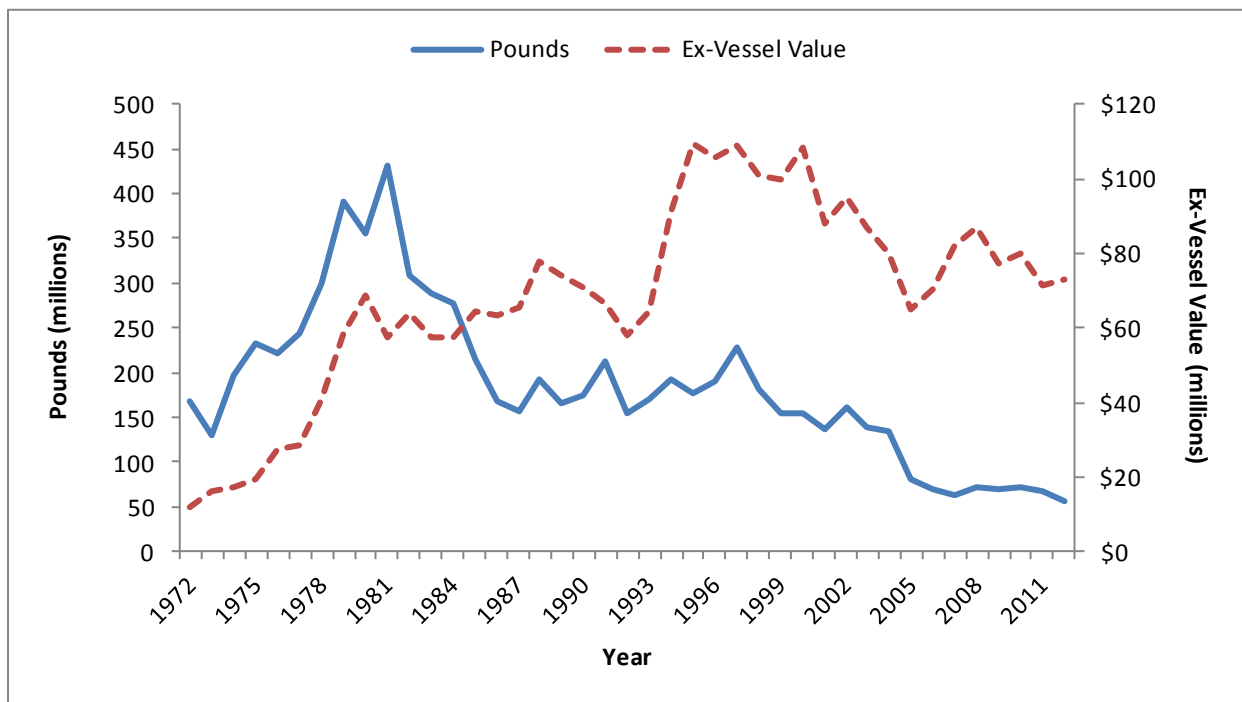

Figure 2. Statewide commercial landings (pounds) and ex-vessel value for North Carolina, 1972–2012.

The number of active dealers in NC has stayed fairly consistent between 1994 and 2012 ranging from 603 to 760 dealers reporting commercial landings per year. The number of participants and trips reporting commercial landings has slowly declined since 1994 resulting in reduced landings over time (Figure 3; Table 1).

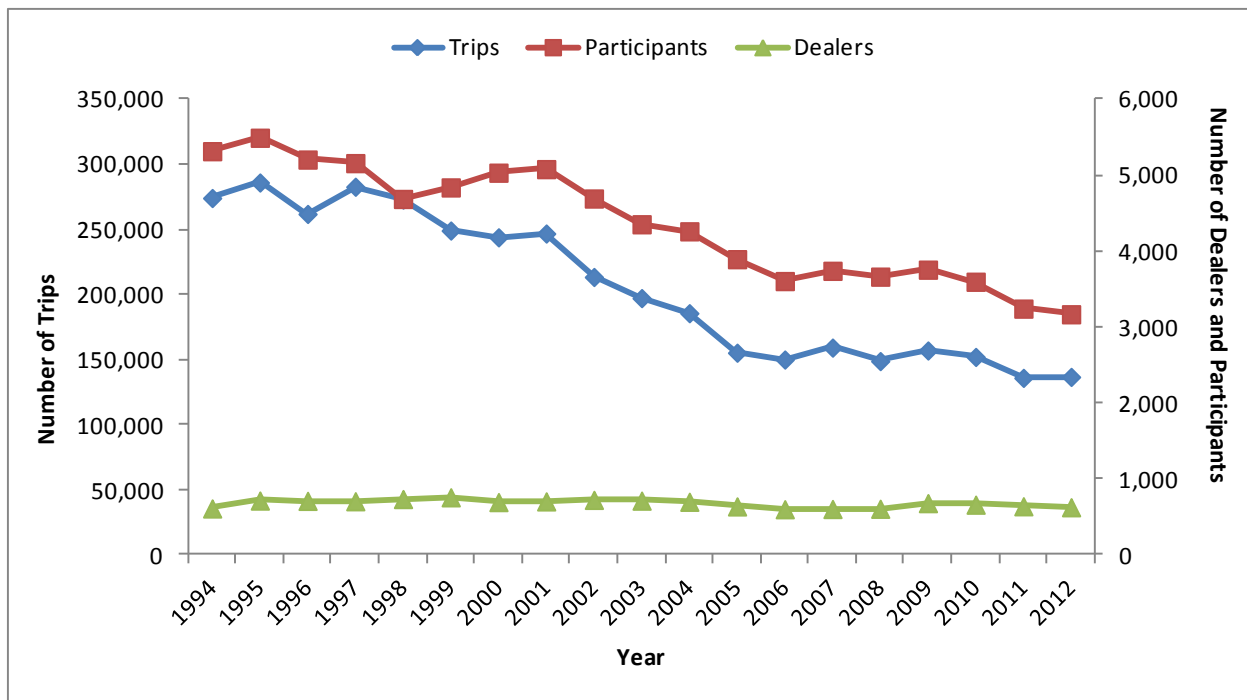

Figure 3. Number of trips, participants, and dealers reporting landings in North Carolina, 1994–2012.

Table 1. Commercial landings (pounds), nominal value, inflation adjusted value, dealer, participants, and trips for North Carolina, 1994–2012.

Year	Pounds Landed	Nominal Value	Adjusted Value	Dealers	Participants	Trips
1994	192,912,325	\$91,270,554	\$91,275,881	613	5,317	274,188

## STATEWIDE LANDINGS AND VALUE BY SPECIES

A comparison of nominal values for finfish and non-fish species showed that as the proportion of finfish declined, proportions of non-fish increased over time (Figure 4; Table A2). Finfish include all bony fishes (i.e. flounders and groupers) and cartilaginous species such as sharks and skates. Non-fish include all commercially sold invertebrate species such as shrimp, crab, oysters, and clams. The finfish composition of the total landings has varied considerably over the years. Finfish composed over 80% of the total landings by weight per year from 1972 to 1984 and have contributed more than 50% to the overall landings from 1972 to 2006 (Table A1). Prior to 2005, a large portion of the annual finfish landings were attributed to a reduction fishery for Atlantic menhaden (*Brevoortia tyrannus*). Nominal values of Atlantic menhaden were relatively low so ex-vessel value comparisons including Atlantic menhaden were not largely affected by the loss of this fishery. Even though finfish composed the majority of the total landings by weight, non-fish species have made up more than 50% of the state's landings value since 1985 (Figure 4; Table A2).

Atlantic menhaden dominated the finfish landings comprising over 46% of the total landings by weight from 1994 to 2012 (Tables 2 and A3). Atlantic croaker (*Micropogonias undulatus*) and dogfish sharks (*Squalus acanthias* and *Mustelus canis*) ranked second and third comprising 11% and 5% of the landings, respectively (Table 2). Summer flounder and southern flounder were the most valuable finfish species in North Carolina with a combined nominal value averaging over \$11 million per year from 1994 to 2012 (Tables 2 and A4). Together, 31% of North Carolina's total landings value came from these two species.

Southern flounder were landed in 16% of the total trips reported in North Carolina, the most of any finfish species caught from 1994 to 2012 (Tables 2 and A3). Weakfish (*Cynoscion regalis*), striped mullet (*Mugil cephalus*), catfishes (*Ictalurus* spp. and *Ameiurus* spp.), and bluefish (*Pomatomus saltatrix*) were each reported in more than 5% of the total trips (Tables 2 and A3).

Hard blue crabs consistently dominated the landings of non-fish species with an average of over 38 million pounds per year contributing 79% of the total weight and 52% of the total value of non-fish between 1994 and 2012 (Tables 3, A5–A6). Shrimp (*Farfantepenaeus* spp. and *Litopenaeus* spp.) ranked second in total landings (14%) and value (28%). Hard blue crabs were also landed in more trips than other non-fish species with 46% of all trips reporting landings of this species (Tables 3, A5–A6). Even though total landings are small compared to hard blue crabs, hard clams were landed in 20% of all trips.

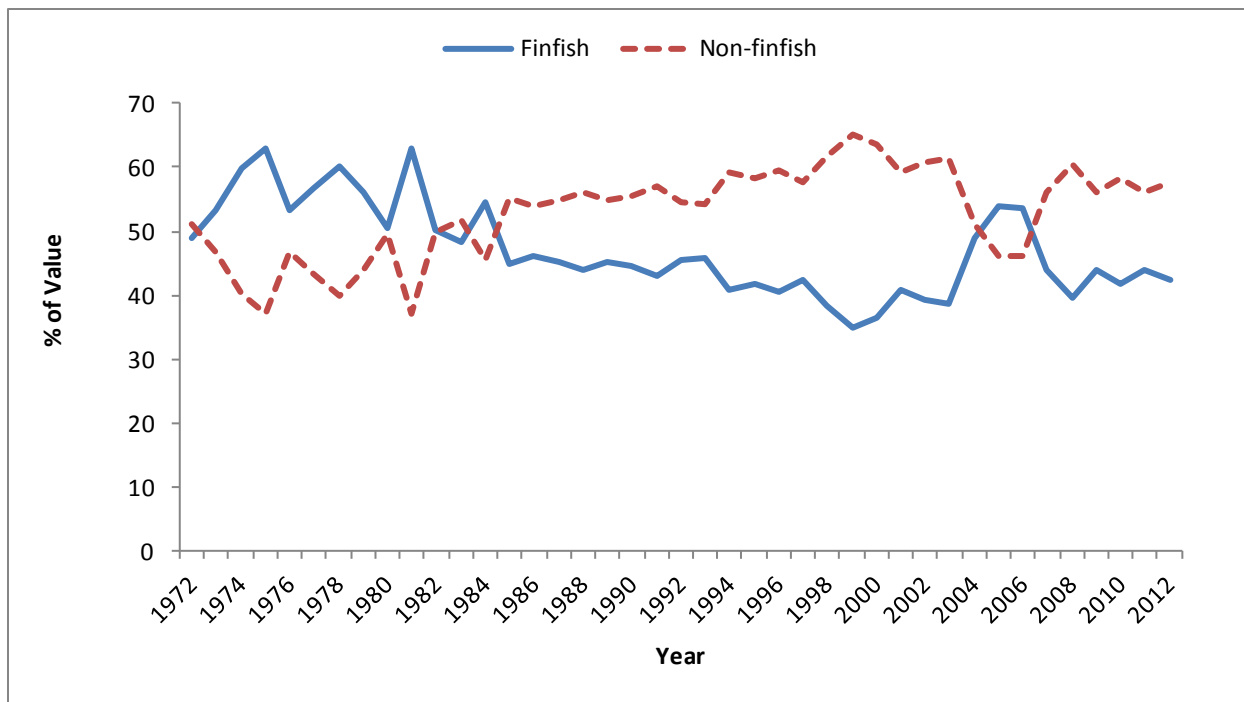

Figure 4. Percentage of finfish and non-finfish by nominal value in North Carolina, 1972–2012.

Table 2. Average nominal value, landings (pounds), and trips by major finfish species for North Carolina, 1994–2012.

### STATEWIDE LANDINGS AND VALUE BY GEAR

Pots, trawls, and gill nets had the highest average value in North Carolina from 1994 to 2012. Due to the menhaden fishery, purse seines had the highest average landings over the same time period. Pots had the highest number of trips averaging over 85,000 per year between 1994 and 2012 (Figure 5; Tables 4, A7–A8).

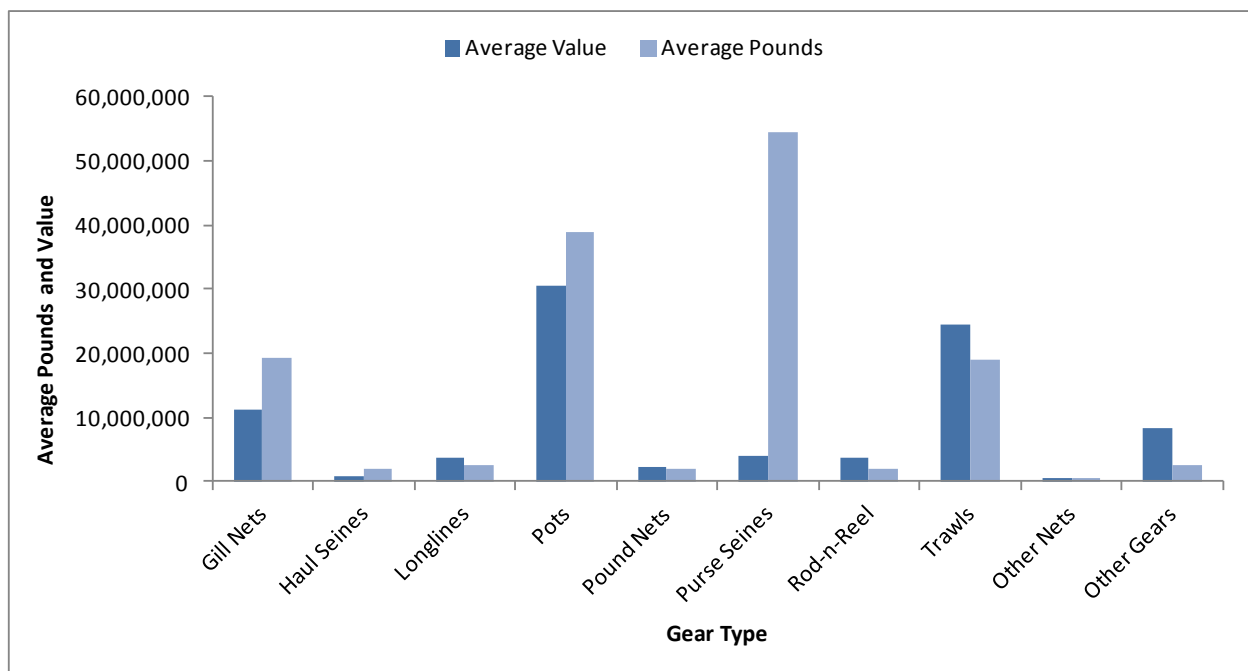

Figure 5. Average ex-vessel value and average landings (pounds) by gear type for North Carolina, 1994–2012.

Table 4. Average ex-vessel value, average landings (pounds), and average number of trips by major gear type for North Carolina, 1994–2012.

Gear	Average Value	% of Total Value	Average Pounds	% of Total Pounds	Average Trips	% of Total Trips
Gill Nets	\$11,127,518	12.59%	19,436,462	15.42%	45,623	22.09%
Haul Seines	\$962,261	1.09%	1,869,018	1.48%	1,052	0.51%
Longlines	\$3,708,766	4.20%	2,510,458	1.99%	520	0.25%
Pots	\$30,438,495	34.44%	38,855,910	30.82%	85,824	41.55%
Pound Nets	\$2,258,988	2.56%	2,068,697	1.64%	3,147	1.52%
Purse Seines	\$3,977,838	3.08%	54,403,910	29.53%	83	0.03%
Rod and Reel	\$3,780,148	4.28%	1,907,863	1.51%	3,615	1.75%
Trawls	\$24,430,419	27.64%	19,110,023	15.16%	15,329	7.42%
Other Nets <sup>1</sup>	\$506,360	0.57%	510,835	0.41%	2,476	1.20%
Other Gears <sup>2</sup>	\$8,445,808	9.56%	2,569,290	2.04%	48,935	23.69%

<sup>1</sup> Other nets include cast net, channel net, butterfly net, and fyke net

<sup>2</sup> Other gears include by hand, gigs, dredges, rakes, scallop scoop, spears diving, tongs, trolling, and trotline

## COASTAL FISHING COUNTIES IN NORTH CAROLINA

There are 19 coastal fishing counties in North Carolina and most are comprised of small towns and unincorporated communities dispersed along the state’s shoreline (Figure 1). The largest coastal county, in terms of land area, is Pender County at 871 square miles (Table 5; US Census 2014). New Hanover is the most populated county with an estimated 209 thousand people in 2012; however, this county is the second smallest with regards to land area (199 square miles; Table 5; LINC 2014; US Census 2014). Hyde and Tyrrell counties are the least populated. Each county had an estimated population of less than 3,000 people in 2012.

The average annual employment across all industries in 2012 varies considerably among coastal fishing counties (Table 5). New Hanover and Onslow counties had the largest number of people employed in 2012 and were also the most populous (Table 5). Tyrrell County, the least populated coastal fishing county in 2012, had the lowest number of employed residents. Of those employed, the average wage per worker is fairly consistent from one county to the next ranging from \$29,384 to \$40,861 (Table 5).

Table 5. Size, population, average annual employment in all industries, and average annual wage per worker by coastal fishing county in North Carolina, 2012.

County	Size <sup>1</sup> (square miles)	Land Area <sup>1</sup> (square miles)	2012 Population <sup>2</sup> Estimate	Avg. Annual <sup>3</sup> Employment	Avg. Annual Wage <sup>3</sup> per Worker
Beaufort	959	828	48,008	18,988	\$35,601

### Landings and Value by Coastal Fishing County

Five coastal fishing counties accounted for over 80% of the state's total landings by weight and value from 1994 to 2012 (Tables 6, A9–A10). These counties include Carteret, Dare, Hyde, Beaufort, and Pamlico. Carteret led all counties averaging over 48 million pounds per year accounting for 38% of the state's total landings by weight mostly due to the Atlantic menhaden purse seine fishery (Table 6). Dare County accounted for 24% of the total landings for North Carolina and had the highest percentage of trips (19%) and value (26%) between 1994 and 2012 (Tables 6 and A9). If Atlantic menhaden were excluded from the overall landings for Carteret County then Dare County would have had the highest average annual landings. In 2012, Dare County landings were 16.7 million pounds valued at \$21 million compared to 6.5 million pounds valued at \$11.5 million reported in Carteret County (Tables A9–A10).

Table 6. Average nominal value, landings (pounds), and trips by coastal fishing county in North Carolina, 1994–2012.

County	Average Value	% of Total Value	Average Pounds	% of Total Pounds	Average Trips	% of Total Trips
Beaufort	\$5,513,124	6.24%	6,901,200	5.47%	18,975	9.22%
Bertie	\$29,734	0.03%	65,661	0.05%	140	0.07%
Brunswick	\$3,953,591	4.47%	2,327,431	1.85%	13,076	6.35%

### Overall Economic Impact

Statewide, North Carolina has seen a recovering workforce in recent years, with 3.8 million people employed in 2012. The mean and median wage per worker has exhibited an increasing trend in recent years. Conversely, the number of active participants in commercial fishing has seen a general decline in the state; however, the majority (over 60%) of those fishing indicates that they derive more than half of their income from commercial fishing (Table 7). In general terms, commercial fishing is not a major contributor to the overall workforce in North Carolina, as less than 0.01% of the workforce is involved directly in commercial harvesting. Nonetheless, as is shown in the following sections, commercial fishing is an integral part of the economy for several counties throughout the state.

Table 7. Number of active participants, claimed income from commercial fishing, average annual wage per worker, median annual wage per worker, average annual employment, and percent of work force estimates for North Carolina, 2008–2012.

Year	Active Participants	% of Participants Claiming More Than 50% of Income from Commercial Fishing	Avg. Annual Wage per Worker- All Occupations <sup>1</sup>	Med. Annual Wage per Worker- All Occupations <sup>1</sup>	Avg. Annual Employment- All Occupations <sup>1</sup>	% of Work-force involved in Commercial Fishing <sup>2</sup>
2008	3,665	62%	\$36,903	\$28,950	4,013,460	0.09%
2009	3,757	62%	-	-	-	-
2010	3,598	69%	\$39,420	\$30,567	3,896,750	0.09%
2011	3,244	71%	\$40,501	\$31,093	3,772,780	0.09%
2012	3,170	69%	\$41,250	\$31,540	3,814,860	0.08%

<sup>1</sup> Data obtained from the North Carolina Employment Security Commission Labor Market website

<http://www.ncesc.com/>. Data were not available for 2009.

<sup>2</sup> Number of Fishermen / Avg. Annual Employment \* 100

Total economic or sales impacts represent the economic impact of industry production and sales while income impacts reflect wages, salaries, and self-employment income. Total economic impacts and income impacts **should not** be added, as this would result in double counting. Statewide, the commercial fishing-harvesting sector generated an estimated 3,473 full-time and part-time jobs, \$51 million in income, and had a total economic impact of \$116 million in 2012 (Table 8). The economic impact from the commercial fishing-harvesting sector involved a wide variety of businesses including those involved in selling petroleum products, boat building and repair, wholesale distribution services, food and beverage sales, real estate, banking, healthcare, and insurance. The commercial fishing-harvesting sector generated the most full-time and part-time jobs in Dare County with 1,003 jobs in 2012 followed by Carteret and Hyde counties with 550 and 380 jobs, respectively. Likewise, the commercial fishing-harvesting sector in Dare County had the greatest economic impact on the state economy with \$33.4 million in 2012 and Carteret County ranked second at \$18.3 million. Of the counties that did not have confidential landings, the commercial fishing-harvesting sector had the least economic impact in Chowan County, followed by Craven and Pender counties (Table 8).

**The economic impact estimates presented should be viewed as conservatively low, as they solely represent the harvesting sector of the commercial fishing industry.** Adequate economic data are not currently available specifically for other sectors in North Carolina as the seafood product moves down the supply chain to the final consumer. This includes the economic activity generated by seafood dealers, distributors, retailers, and restaurants as well as how much seafood product remains in the state of North Carolina for consumption. Economic impact estimates represent impacts to the economy of North Carolina.

Table 8. Economic impact by county of the commercial fishing-harvesting sector on the North Carolina state economy, 2012.

## **ECONOMIC CHARACTERISTICS BY COASTAL FISHING COUNTY**

### **Beaufort County**

Beaufort County is the home of North Carolina's oldest town, Bath, which served as the state's first capital in the eighteenth century. Towns in Beaufort County, such as Bath and Washington, served historically as ports for North Carolina and some had thriving shipbuilding trades (NorthCarolinahistory.org 2014). While Pamlico River runs straight through the middle of Beaufort County, the eastern edge of the county is also bordered by Pungo River and Pamlico Sound. With direct access to three large coastal waterbodies, commercial fishing is the chosen profession for many people residing in Beaufort County (Table 9). On average, a total of 77% of active fishermen in Beaufort County claim that more than 50% of their income comes from commercial fishing.

In 2010, Beaufort County saw a peak in commercial fishing participation. In this year, a total of 569 commercial fishing licenses were issued to Beaufort County residents, 246 of which were used. There were 220 residents that recorded commercial landings of seafood (Table 9). Of the residents reporting landings, 78% indicated receiving more than 50% of their income from commercial fishing. In 2012, the number of licenses issued had dropped to 514, with 201 of those licenses used and 180 county residents recording commercial landings. The active participants claiming more than 50% of their income from commercial fishing held steady at 78% (Table 9).

In recent years, Beaufort County has had a growing population but fluctuating workforce. The average and median wages earned by workers in the county showed an increasing trend throughout the time series. The percent of the workforce involved in commercial fishing in either a full-time or part-time capacity has remained around 1%, dropping slightly below 1% in 2012 (Table 10).

Total landings in Beaufort County peaked in 1996 at almost 14 million pounds but have been declining ever since. Since 2004, landings have remained between 3 and 5 million pounds per year (Table 11; Figure 6). Nominal and inflation-adjusted values follow the same trend as landings but variations in values over time are not as extreme (Figure 6). Dealers, participants, and trips reporting landings in Beaufort County have also declined since the late 1990s (Table 11).

The mean value of landings per trip recorded in Beaufort County has ranged between \$199 and \$383, while the median nominal value of landings per trip has ranged from \$122 to \$317. The highest nominal value per trip was observed in 2010 at \$383 for the mean value and \$317 for the median value. When adjusted for inflation, the highest median value was also observed in 2010, while the highest mean value occurred 1996 (Table 12).

As can be seen when comparing the mean and median annual value of individual landings, fishermen recorded a wide range of landings. On a nominal and inflation-adjusted basis, peaks in individual landings were seen in 1999 and 2000 as well as in 2010 and 2011. It is interesting to note that these peaks do not coincide with the peaks in the value of overall landings (Table 13).

Top gears used in Beaufort County by landings and value were pots, trawls, and gill nets. Pots accounted for 81% of the total value and 88% of the total pounds landed between 1994 and 2012 (Table 14). The top 10 species landed in Beaufort County from 1994 to 2012 are presented in Table 15. Hard blue crabs made up 83% of the total value and 91% of the total pounds during this time period.

## **Bertie County**

Agriculture is the largest component of the economy in Bertie County whereas commercial fishing contributes a relatively small part to the county economy. For the last five years, only 17 licenses that allow the sale of commercial seafood have been bought by fishermen in Bertie County. On average, only 9 of those 17 get used each year (Table 16).

Bertie County has seen a decreasing county population and workforce over the past five years. Despite this shrinking workforce, the overall wage per worker has exhibited an increasing trend. In 2012, there were 7,470 individuals employed in Bertie County, however only around a tenth of a percent were involved in commercial fishing (Table 17).

Landings and value in Bertie County have been on the decline since 1994. Since 2003, annual landings and value have remained fairly consistent (Table 18; Figure 7). The small spike in landings during 2011 can be attributed to increased landings of catfishes and gar (Table A31). A decline in participation has caused data for many of the years between 1994 and 2012 to be confidential. The number of dealers has declined to only one being active in three out of the last four years while the number of fishermen and trips are only a quarter of what they were in the 90s (Table 18).

As with the trend in overall landings, the mean and median value of landings per trip tended to drop throughout the time series, with many years remaining confidential due to limited participation. In 2011 there was a slight increase in landings per trip on a nominal and inflation-adjusted basis, despite having among the lowest value of overall landings on record (Table 19). The mean and median value of annual landings per fisherman decreased throughout the time series. Of the data that is not confidential, the lowest values were observed in 2011 (Table 20).

Trawls had the highest average value between 1994 and 2012 while pound nets had the highest average landings and trips for that time period (Table 21). Even though trawls had the highest average value per year, pound nets made up 57% of the total value for 1994 to 2012. Pound nets had an average of 102 trips per year but this is not an accurate representation of the current pound net fishery in this county due to a large decline in participation in recent years resulting in less than 100 pound net trips reported per year since 2006 (Table 21). Reduced participation in the pound net fishery is the result of a moratorium placed upon the river herring fishery in 2007 due to severe declines in the stock (Table A12).

Shrimp had the highest average value in Bertie County even though it contributed less than 10% of the total value for the county from 1994 to 2012 (Table 22). River herring and gizzard shad combined made up 45% of the total landings while hard blue crabs had the highest percentage of the value (Table 22).

## **Brunswick County**

The economy in Brunswick County has been largely impacted by commercial and recreational fishing as well as tourism but in recent years, agriculture and manufacturing have been increasing in importance (NorthCarolinahistory.org 2014). Ocean Isle Beach has held the North Carolina Oyster Festival for over 30 years to celebrate oyster fisheries in NC and fresh coastal seafood.

On average, 860 licenses to sell commercial catch of seafood were issued to residents of Brunswick County but only around 400 of those licenses get used each year. Less than 50% of the active fishermen who live in Brunswick County claim to fish full-time (Table 23).

Over the past five years, Brunswick County saw a peak in commercial fishing participation in 2009. That year, 901 commercial fishing licenses were issued to Brunswick County residents, 440 of which were used and there were 426 residents that recorded commercial landings of seafood. Of the active fishermen living in Brunswick County, less than half indicated receiving more than 50% of their income from commercial fishing. In 2012, the number of licenses issued dropped to 819, with 321 of those licenses used and 310 county residents recording commercial landings (Table 23). Over the time series, there was a decreasing trend in the percentage of active participants claiming to commercial fish full-time signaling a slight shift to more part-time commercial fishing in the area.

In recent years, Brunswick County has had a growing population, but slightly fluctuating workforce. The average and median wages earned by workers in the county showed an increasing trend throughout the time series. The percent of the workforce involved in commercial fishing in either a full-time or part-time capacity has been decreasing, from a high of 0.93% in 2009 to a low of 0.68% in 2012 (Table 24).

Annual landings for Brunswick County have been slowly declining since 1995. Nominal value displays a similar trend but showed a peak in 1999 around \$5.3 million, only slightly less than the highest yearly value in 1995 (Table 25; Figure 8). While the landings and value continued to decline between 2006 and 2012, the number of dealers showed a slight increase. It is likely that some commercial fishermen in the area have made the decision to become seafood dealers as well to help integrate their business to be involved in both catch and selling seafood.

The mean nominal value of landings per trip recorded in Brunswick County has ranged between \$224 and \$447, while the median nominal value of landings per trip has ranged from \$58 to \$99. The highest nominal and inflation-adjusted mean values per trip were observed in 1999 at \$447 and \$397, respectively. The highest median value was also observed in 2010 (Table 26). The substantial differences between mean and median values per trip show a wide range of trip values. This is likely related to the license information presented in Table 23 that indicates the majority of license holders do not derive more than 50% of their income from commercial fishing and are therefore not full-time fishermen. Many license holders relying on commercial fishing for the majority of their income may have exhibited a relatively higher value of landings per trip, while many of the part time fishermen recorded only minimal landings per trip.

A similar trend can be seen when comparing mean and median annual landings per fisherman. The mean values of landings per fishermen were much higher than the median values

throughout the time series. Peaks in mean values were seen in 1998 and 1999. The highest median values were observed in 2006 and 2007 (Table 27).

Trawls and rod and reel had the highest average landings and value while contributing 66% to the total value and 58% to the total landings between 1994 and 2012 (Table 28). As expected based on the gear types that topped the landings and value for Brunswick County, shrimp had the highest average value by species (34% of the total value) followed by snappers (15% of the total value) and groupers (11% of the total value; Table 29). Hard blue crabs made up 11% of the total pounds landed.

## Camden County

Camden County has a tourism driven economy thriving around hunting and fishing based activities and the Great Dismal Swamp, a 100,000 acre preservation on the North Carolina/Virginia border (NorthCarolinahistory.org 2014). The majority of active commercial fishermen living in Camden County currently consider themselves to be full-time fishermen (Table 30). Bordered by the Pasquotank River and Albemarle Sound, Camden is one of North Carolina's smaller coastal fishing counties but landings and values from this county are in the millions (Figure 9).

Over the past five years, Camden County has seen steady participation in commercial fishing. In 2012, 69 commercial fishing licenses were issued to Camden County residents, 44 of which were used and there were 36 residents that recorded commercial landings of seafood. Of the license holders recording landings, the vast majority (81%) indicated receiving more than 50% of their income from commercial fishing (Table 30).

In recent years, Camden County has had a growing population and relatively steady workforce. The average and median wages earned by workers in the county showed an increasing trend from 2008 to 2011, with a drop in 2012. The percent of the workforce involved in commercial fishing in either a full-time or part-time capacity has been steady at just under 1% (Table 31).

In contrast with the other counties discussed so far, Camden County landings and values have shown an overall increasing trend from 1994 to 2012. There were a few years between 2004 and 2006 where landings dropped to around 2 million pounds but 2012 landings were the highest to date at over 4.3 million pounds valued at \$4.3 million (Table 32; Figure 9). Over the years, the number of trips have shown the same trend as landings and value whereas the number of dealers and fishermen selling in Camden County has been more variable (Table 32).

Mean and median values per trip recorded in Camden County have remained fairly steady and relatively close from 1995 to 2012. Unusually low landings were seen in 1994; however this may have been due to problems with full implementation of the trip ticket system. The relatively close mean and median values reflect a smaller range of trip values throughout the times series (Table 33). Furthermore, the landings per trip as well as per fisherman in Camden County are among the highest of any county in this report (Table 34). This is reflective of the vast majority of fishermen noting a high reliance on commercial fishing for income.

Ninety-eight percent of the landings and value in Camden County is attributed to pot gear averaging over 2.4 million pounds with a value of over \$2.3 million (Table 35). Blue crabs (hard, soft, and peeler) are 98% of the total species landed in this county (Table 36). Natural fluctuations in blue crab stocks and larval movement throughout the state may contribute to landings fluctuations in this county since the vast majority of the annual landings are blue crabs.

Table 30. Number of licenses issued, licenses used, active participants, and claimed income from commercial fishing for Camden County, 2008–2012. Data are based on physical address of the participant.

Year	Licenses Issued*	Licenses Used	Active Participants	% of Active Participants Claiming More Than 50% of Income from Commercial Fishing
2008	62	43	33	85%
2009	65	51	36	89%
2010	68	49	37	89%
2011	69	49	37	86%
2012	69	44	36	81%

## **Carteret County**

Carteret County has had a long history of commercial fishing and is bordered by six of North Carolina's major waterbodies: Neuse River, Pamlico Sound, Core Sound, North River/Back Sound, Newport River, and Bogue Sound. Carteret County was the home to a large scale menhaden reduction fishery until 2005. The reduction fishery operated out of Beaufort which was once known as "Fishtown" hinting at the importance of the fishing industry in this county (NorthCarolinahistory.org 2014).

Thousands of commercial fishing licenses are issued to Carteret County residents each year and around 700 are used on a yearly basis. This is the largest number of licenses issued and used of any county in North Carolina. The percentage of people claiming full-time employment from commercial fishing has been increasing in recent years. In 2012, 1,783 licenses were issued to Carteret County residents with landings being reported by 671 of these licenses used by 658 individuals (Table 37).

In recent years, Carteret County has had a growing population and steady workforce. The average and median wages earned by workers in the county showed an increasing trend throughout the time series. The percent of the workforce involved in commercial fishing in either a full-time or part-time capacity has remained steady at a little over 2% (Table 38).

Landings in Carteret County were over 50 million pounds from 1994 to 2004 peaking at almost 129 million pounds in 1997. These landings were vastly due to menhaden and when the menhaden reduction plant in Beaufort closed in 2005, landings dramatically dropped. Since 2005, landings have remained around 6 million pounds (Table 39; Figure 10). Values have been declining since 1997 along with landings but since prices for menhaden range from \$0.04 to \$0.09 per pound the decrease over time was not as drastic as the decrease in landings weight. A small increase in value, trips, and participants occurred in 2012, however, the number of dealers continued to decline (Table 39).

The mean nominal value of landings per trip recorded in Carteret County has ranged between \$378 and \$653, while the median nominal value of landings per trip has ranged from \$91 to \$156. The highest value per trip on a nominal basis was observed in 2012 at \$649 for the mean value and \$156 for the median value. When adjusted for inflation, the highest mean and median value was also observed in 1997 (Table 40).

When comparing mean and median annual values of individual landings, fishermen reported a wide range of landings amounts. Peaks in mean nominal and inflation-adjusted values per fisherman were seen in 1997 and 1998. These peaks coincide with the highest values of overall landings. The highest nominal median value per fisherman occurred in 2004. On an inflation adjusted basis, mean annual values per fisherman showed a decreasing trend through the time series, with the exception of 2012. Inflation adjusted median values fluctuated throughout the time series (Table 41).

The highest average landings for Carteret County came from purse seines used in the menhaden fishery averaging over 54 million pounds per year and contributed 77% of the total landings between 1994 and 2012. The highest average value came from the trawl fishery (\$5.9 million) which also had the second highest average landings (3.7 million pounds; Table 42).

On average, shrimp was the most valuable fishery in Carteret County followed by menhaden, mostly due to quantity of the catch in this fishery. Flounder, blue crabs, and hard clams were also highly sought after with a summed average of over 21,000 trips catching these species per year (Table 43).

Table 37. Number of licenses issued, licenses used, active participants, and claimed income from commercial fishing for Carteret County, 2008–2012. Data are based on physical address of the participant.

Year	Licenses Issued*	Licenses Used	Active Participants	% of Active Participants Claiming More Than 50% of Income from Commercial Fishing

## Chowan County

Chowan County is the smallest coastal fishing county in North Carolina based on land area (173 square miles) but direct access to Chowan River and Pamlico Sound provide numerous fishing opportunities for residents (US Census 2014). On average, there are 37 active commercial fishermen living in Chowan County per year but only about half claim they earn more than 50% of their annual income from commercial fishing (Table 44).

In recent years, Chowan County has had a decreasing population and workforce. The average and median wages earned by workers in the county did show an increasing trend throughout the time series. The percent of the workforce involved in commercial fishing in either a full-time or part-time capacity has remained steady at approximately 0.6% to 0.7% (Table 45).

Total landings and value in Chowan County have showed an overall decline since 1994 however a slight increase was seen in 2012. An upswing in landings occurred in 2008 most likely due to large increases in landings of hard blue crabs and southern flounder that year (Table 46; Figure 11).

Both average and median values per trip peaked in 2008. These values were relatively close, signaling consistency in the value of landings for each trip (Table 47). This coincided with a peak in mean annual values per fisherman; however the median values per fisherman were highest in 1998. Unlike the value per trip, the median annual values per fisherman were a great deal lower than the average (Table 48).

Ninety-two percent of the total value between 1994 and 2012 came from gill nets (49%), pots (29%), and pound nets (15%). These three gears also accounted for 85% of the total landings in this county (Table 49). Southern flounder, hard blue crab, and catfishes were the three highest valued species and were in the top five species with the highest average landings in Chowan County (Table 50).

Table 44. Number of licenses issued, licenses used, active participants, and claimed income from commercial fishing for Chowan County, 2008–2012. Data are based on physical address of the participant.

Year	Licenses Issued*	Licenses Used	Active Participants	% of Active Participants Claiming More Than 50% of Income from Commercial Fishing
2008	64	38	36	53%

## Craven County

Craven County, named after William, Earl of Craven, is home to New Bern, one of the oldest towns in coastal North Carolina. New Bern, one of the county's largest cities, once served as the state capital and an important river port in the 18<sup>th</sup> century (Craven County Government 2014). Much of the Neuse River runs through Craven County allowing water access to many of the county's residents.

Over 200 commercial fishing licenses are issued every year to fishermen residing in Craven County but only about 30% of them get used. In the last few years, the number of active fishermen has declined but the number considering themselves as full-time fishermen has increased (Table 51). This reflects an increasing reliance on commercial fishing by active participants.

Craven County has had an increasing population from 2008 to 2012. The size of the county's workforce dropped in 2009, but recovered in the following years. The average and median wages earned by workers in the county showed an increasing trend throughout the time series. The percent of the workforce involved in commercial fishing in either a full-time or part-time capacity has remained steady at around 0.15% and is less than many other coastal counties (Table 52).

Landings and value in Craven County have been somewhat variable over time but have not shown the major variations that are seen in counties previously discussed (Table 53; Figure 12). Trips did show a declining trend until stabilizing around 2,500 trips in 2007 (Table 53). In the late 90s, the number of fishermen selling seafood in Craven County was around 130 but sharply declined to a low of 48 in 2005. From 2009 to 2011, the number of fishermen exceeded 100 individuals due to dealers located in the county purchasing seafood from fishermen residing in other counties.

Both average and median values per trip were highest on a nominal basis towards the end of the time series. These values were relatively close, signaling consistency in the value of landings for each trip (Table 54). There was a peak in mean and median annual values per fisherman in the mid 2000's, with average values per fisherman decreasing since then. Unlike the value per trip, the median annual value per fisherman was a great deal lower than the average (Table 55).

Pots and gill nets made up 96% of the total landings and 89% of the total value for Craven County. Pots alone contributed more than 75% of the landings and value with average landings of 577,006 pounds valued at \$454,096 (Table 56).

Hard blue crabs are 81% of the total landings in Craven County and 73% of the total value (Table 57). Average landings of hard blue crabs are over 575,000 pounds. Other species with average landings higher than 10,000 pounds include striped mullet, southern flounder, shrimp, American shad (*Alosa sapidissima*), and spot (*Leiostomus xanthurus*; Table 57).

## **Currituck County**

The eastern side of Currituck County is completely bordered by Currituck Sound while half of the western side of the county meets Albemarle Sound providing numerous access points for fishermen. Over 200 licenses are issued to residents of Currituck County on an annual basis. Typically, only half of these licenses get used. In the last five years, around 100 fishermen from Currituck County participate in commercial fishing each year with about 75% considering themselves full-time fishermen (Table 58).

Currituck County has had a slightly increasing population from 2008 to 2012. The size of the county's workforce dropped in 2008 and 2009, but recovered in the following years. The average and median wages earned by workers in the county showed an increasing trend throughout the time series. The percent of the workforce involved in commercial fishing in either a full-time or part-time capacity has been decreasing with 0.76% being involved in commercial fishing in 2012 (Table 59).

Landings and values in Currituck County have been fairly consistent throughout the years. Landings ranged from 1.3 million to 3.3 million pounds between 1994 and 2012. Nominal values ranged from \$1 million to \$3.6 million. Landings spikes in 2002 and 2009 were likely the result of increased blue crab landings during good recruitment years. The overall number of participants has been declining since 1994. Trip counts increased for a number of years before peaking in 2002 with over 6,000 trips and then declining. Dealer numbers were fairly stable over time with a peak in 2009 (Table 60).

Both average and median values per trip were highest on a nominal basis towards the end of the time series. These values were relatively close, signaling relative consistency in the value of landings for each trip (Table 61). There was a peak in mean and median annual values per fisherman in the early 2000's and then again in the late 2000's. Unlike the value per trip, the median annual value per fisherman was a great deal lower than the average (Table 62).

Pots were responsible for the vast majority of the landings and value for Currituck County comprising 91% of the total landings and 89% of the total value from 1994 to 2012 (Table 63). Annual trip counts using pots average over 3,500 trips.

Blue crabs (hard, soft, and peeler) made up 90% of the total landings and 88% of the total value in Currituck County. Southern flounder also contributed a small but noticeable portion of the landings (3.50%) and value (7.23%) compared to other species landed (Table 64).

Table 58. Number of licenses issued, licenses used, active participants, and claimed income from commercial fishing for Currituck County, 2008–2012. Data are based on physical address of the participant.

Year	Licenses Issued*	Licenses Used	Active Participants	% of Active Participants Claiming More Than 50% of Income from Commercial Fishing
2008	207	108	100	69%

## Dare County

Dare County is the largest coastal fishing county by total area but 75% of the county is water (US Census 2014). Much of the Outer Banks run through Dare County and are the location of numerous beach resorts and several lighthouses. Dare County is also the home to several state historical sites and wildlife refuges such as the Wright Brothers Memorial, Fort Raleigh National Historic Site, and Pea Island National Wildlife Refuge. Due to these attractions, tourism has remained the primary source of commerce in this county since the nineteenth century (NorthCarolinahistory.org 2014).

Dare County had close to 1,000 licenses issued to commercial fishermen every year but only about half get used annually. Around 90% of the active fishermen in Dare County claim more than 50% of their income comes from commercial fishing, the most of any coastal county in North Carolina (Table 65).

Dare County had a steady population and workforce from 2008 to 2012. The average and median wages earned by workers in the county were variable but showed a slightly increasing trend throughout the time series. The percent of the workforce involved in commercial fishing in either a full-time or part-time capacity was a little over 2%, among the highest of any coastal county in the state (Table 66).

Landings from Dare County have consistently been over 20 million pounds for all years except 2012 and ranged from 16.7 million pounds to 43 million pounds. Nominal values were close to or exceeded \$20 million every year since 1994 (Table 67; Figure 14). Over time, dealers, trips, and participants landing seafood in Dare County have declined (Table 67).

In Dare County, both average and median values per trip were highest on a nominal basis towards the end of the time series. These values were relatively far apart, signaling regular inconsistency in the value of landings for each trip. Given the wide range of fishing operations based in Dare County as well as abundant access to both inshore and Atlantic Ocean waters, this difference is not unexpected (Table 68).

Nominal mean annual values per fisherman showed an increasing trend from 1994 to 2012. When inflation is taken into account, mean values per fisherman have remained steady. Median nominal and inflation-adjusted values per fisherman have fluctuated, but remained fairly steady throughout the time series (Table 69).

Four gear types made up the majority of the landings and value in Dare County. Gill nets (37%), trawls (26%), pots (23%), and longlines (6%) made up 92% of the total landings. These four gears represent 87% of the total value (Table 70). Gill nets had the highest average landings from 1994 to 2012 at over 11 million pounds while pots had the highest average value (over \$6 million; Table 70).

Many species are valued over \$1 million dollars each year in Dare County. Hard blue crabs (\$4.1 million), Atlantic croaker (\$2.4 million), summer flounder (\$2.1 million), tunas (\$2.0 million), soft blue crab (\$1.7 million), southern flounder (\$1.5 million), and shrimp (\$1.1 million) made up 65% of the total value (Table 71). Most of these species made up less than 5% of the total landings in Dare County except for croaker (23%) and hard blue crabs (21%; Table 71).

## Hertford County

The Chowan River serves as an important source of freshwater and fishing access in Hertford County; however commercial fishing is only a small part of the economy (NorthCarolinahistory.org 2014). In 2012, four fishermen residing in Hertford County sold seafood to licensed seafood dealers but only one of them claims to be a full-time fisherman (Table 72). Over the last five years, Hertford has had the lowest number of active fishermen of all coastal fishing counties in North Carolina.

Hertford County has seen a steady population but decreasing workforce over the past five years. Despite this shrinking workforce, the overall wage per worker has exhibited an increasing trend. In 2012, there were 8,879 individuals employed in Hertford County, however very few (0.05%) were involved in commercial fishing (Table 73).

Landings and values in Hertford County were variable ranging from 13,462 pounds valued at \$5,986 to 97,697 pounds valued at \$24,685 (Table 74; Figure 15). Almost all of the landings and value data since 2000 were confidential due to reduced participation from fishermen and dealers in this county.

The mean and median value of landings per trip tended to fluctuate greatly throughout the time series, with many years remaining confidential due to limited participation (Table 75). The mean and median value of annual landings per fisherman followed a similar trend. Of the data that is not confidential, the lowest mean value per fisherman was observed in 1997, while the lowest median value per fisherman occurred in 2010 on both a nominal and inflation-adjusted basis (Table 76).

Pound nets are responsible for 94% of the total landings and 90% of the total value in Hertford County. The pound net fishery averages 76 trips per year and has an average annual value of almost \$13,000 (Table 77).

The top three species most likely caught in pound nets were river herring (*Alosa pseudoharengus* and *A. aestivalis*), gizzard shad (*Dorosoma cepedianum*), and white perch (*Morone americana*) making up 88% of the total landings in Hertford County (Table 78). In 2007, the NC Marine Fisheries Commission put a statewide moratorium on river herring which cut landings from the pound net fishery in this county in half (Tables A20 and A39). River herring, white perch, and striped bass (*Morone saxatilis*) were the top three species by value from 1994 to 2012 (Table 78).

Table 72. Number of licenses issued, licenses used, active participants, and claimed income from commercial fishing for Hertford County, 2008–2012. Data are based on physical address of the participant.

Year	Licenses Issued*	Licenses Used	Active Participants	% of Active Participants Claiming More Than 50% of Income from Commercial Fishing

Table 78. Average ex-vessel value, average landings (pounds), and average number of trips for the top 10 species by value in Hertford County, 1994–2012.

Species	Average Value	% of Total Value	Average Pounds	% of Total Pounds	Average Trips
River herring	\$8,091	56.80%	24,315	63.08%	60
White perch	\$2,728	19.15%	4,432	11.50%	84
Striped bass	\$2,464	15.48%	1,399	3.25%	51
Catfishes	\$421	2.96%	1,977	5.13%	61
Gizzard shad	\$370	2.60%	5,073	13.16%	57
American shad	\$253	1.78%	418	1.09%	22
Southern flounder	\$75	0.14%	46	0.03%	7
Yellow perch	\$46	0.27%	43	0.09%	9
Red drum	\$27	0.01%	25	0.00%	1
Atlantic	\$17	0.01%	240	0.07%	8

## Hyde County

A large portion of Hyde County is bordered by Pamlico Sound and many coastal fishing communities such as Swan Quarter and Engelhard rely on the Sound and fishing as a source of income. To the west, Hyde County is separated from Beaufort County by the Pungo River. While Hyde County is large in size, it is one of the least populated counties on the NC coast (LINC 2014; US Census 2014).

Close to 400 licenses are issued every year to residents of Hyde County for the purpose of harvesting and selling commercial seafood. Less than half of these licenses get used resulting in around 175 active fishermen. Over 80% of the people actively participating in commercial fishing claim full-time status (Table 79).

In recent years, Hyde County has had a steady population, but somewhat variable workforce. The average and median wages earned by workers in the county showed a variable, but overall increasing trend from 2008 to 2011, with a drop in 2012. The percent of the workforce involved in commercial fishing in either a full-time or part-time capacity has been around 6% to 7%, among the highest of all coastal counties in North Carolina (Table 80).

In the late 90s, Hyde County landings and values were increasing steadily but sharply declined in 2001 due to reduced hard blue crab landings. Since 2001, landings have been variable wavering around 8.5 million pounds (Table 81; Figure 16). Trends in the number of dealers and fishermen follow those of landings and value (Table 81).

Mean and median values per trip recorded in Hyde County have shown an increasing trend on both a nominal and inflation-adjusted basis through the time series, with a peak in the late 2000's. The mean and median values were fairly far apart, reflecting a commonly wide range in the value per fishing trip (Table 82). Nominal mean values of annual landings per fisherman showed an increasing trend from 1994 to 2012. When inflation is taken into account, with the exception of a few select years, the mean value of landings per fisherman have remained fairly steady. Median nominal and inflation-adjusted values per fisherman have fluctuated, but remained fairly steady through the time series as well (Table 83).

Pots, trawls, and gill nets dominated the landings and value in Hyde County between 1994 and 2012. Pots ranked first in landings contributing 45% of the total for the county followed by trawls (27%) and gill nets (24%). Unlike landings, trawls ranked first in value (46%). Ranked second and third in value were pots (33%) and gill nets (13%), respectively (Table 84).

Species contributing the most to the landings in Hyde County were hard blue crabs, shrimp, and Atlantic croaker. Hard blue crabs and shrimp also topped the species by value followed by summer flounder and southern flounder (Table 85).

Table 79. Number of licenses issued, licenses used, active participants, and claimed income from commercial fishing for Hyde County, 2008–2012. Data are based on physical address of the participant.

Year	Licenses Issued*	Licenses Used	Active Participants	% of Active Participants Claiming More Than 50% of Income from Commercial Fishing
2008	364	204	172	77%

## New Hanover County

New Hanover County is one of the smallest counties in NC but is the most populous (LINC 2014; US Census 2014). Only Chowan County is smaller by area. New Hanover County has direct access to several bodies of water including Masonboro Sound, Cape Fear River, and the Atlantic Ocean. The number of commercial fishing licenses issued to fishermen living in this county has been consistent over the last five years but the number of active fishermen (i.e., fishermen who sold their catch to licensed seafood dealers) has recently been declining (Table 86). Less than half of the active fishermen living in New Hanover County claim to get more than 50% of their income from commercial fishing.

In recent years, New Hanover County has had an increasing population, but somewhat variable workforce. The average and median wages earned by workers in the county exhibited an increasing trend. The percent of the workforce involved in commercial fishing in either a full-time or part-time capacity was relatively small, at around 0.2% (Table 87).

Landings and values in New Hanover County have been gradually declining over the years (Table 88; Figure 17). Landings ranged from 1.4 million to 2.4 million pounds. The number of dealers operating in New Hanover has remained fairly constant between 1994 and 2012 while trips and fisherman numbers have reduced by half in recent years (Table 88).

Mean and median values per trip have been fairly steady from 1994 to 2012, despite decreasing overall landings value. The relatively close mean and median trip values indicate a somewhat consistent value of landings (Table 89). The mean and median annual value of landings per fisherman has seen a variable but increasing trend over time, with the highest nominal values occurring in 2012 (Table 90).

Pots, rod and reel, trawls, and gill nets made up the majority of the landings and value in New Hanover County. These four gears made up 81% of the total landings from 1994 to 2012. Pots contributed about half of the 81%, followed by rod and reel and trawls each contributing 14%. Average annual landings from pots were 738,768 pounds valued at close to \$677,000 (Table 91). The "Other Gears" category made up 30% of the total value between 1994 and 2012, the vast majority from trolling for king mackerel, gigging for southern flounder, and hand harvest of clams and oysters (Table A22).

Hard blue crabs were 35% of the total landings in New Hanover County from 1994 to 2012. Shrimp, king mackerel (*Scomberomorus cavalla*), and groupers (*Epinephelus* spp. and *Mycteroperca* spp.) were also important components of the landings and when combined contribute another 29% to the total county landings over time. These four species had the most valuable landings between 1994 and 2012. Other species of higher value to this county were hard clams, oysters, and sea basses (*Centropristis* spp.; Table 92).

## Onslow County

Onslow County, located in the southern part of the state, is bordered by several notable waterbodies including New River, White Oak River, Stump Sound, and the Atlantic Ocean. Commercial fishing has historically been an important component of the economy in Onslow County (NorthCarolinahistory.org 2014). For the past 60 years, the town of Swansboro has held an annual Mullet Festival to acknowledge the striped mullet and white mullet fisheries and their history in Onslow County. In addition, the small town of Sneads Ferry has held a Shrimp Festival every year for over 40 years to honor shrimpers and the local fishing community.

Around 900 licenses are issued each year to residents of Onslow County, however the number of issued licenses as well as the number of licenses used and the number of active participants has been declining in recent years. Less than half of the licenses that get issued each year get used (Table 93). More than half of the people living in Onslow County who sold their landings to commercial seafood dealers in the last five years claim to be full-time fishermen (Table 93).

In recent years, Onslow County has had an increasing population and workforce. The average and median wages earned by workers in the county exhibited an increasing trend over time as well. The percent of the workforce involved in commercial fishing in either a full-time or part-time capacity was relatively small and decreased throughout the times series, with about 0.5% of the workforce being involved in commercial fishing in 2012 (Table 94).

Landings in Onslow County have been relatively stable from 1994 to 2012 ranging from 1.5 million pounds to 3 million pounds per year. Value trends are similar to landings but a little more variable (Table 95; Figure 18). Dealer numbers have also remained fairly stable while trips and participants have declined over time (Table 95).

Mean and median values per trip exhibited a slightly upward trend on a nominal basis and remained relatively steady on an inflation-adjusted basis through the time series. The comparatively close mean and median trip values indicate a somewhat consistent value of landings (Table 96). The mean and median annual values of landings per fisherman have seen a variable but increasing trend over time, with the highest nominal values occurring in 2012. The mean inflation-adjusted values of landings per fisherman have remained fairly steady, but the median values have been increasing in recent years (Table 97).

Trawls, gill nets, and pots comprised 77% of the total landings in Onslow County and 55% of the total value but the "Other Gears" category made up more of the total value (36%) than any other individual gear grouping and had an average value of \$1.8 million (Table 98). The hard clam fishery was the major contributor to high values in the "Other Gears" category through the use of dredges and hand harvesting techniques including rakes and tongs (Table A23).

Shrimp (\$1.8 million) and hard clams (\$1.6 million) had the highest average values for Onslow County making up a combined 66% of the total value (Table 99). Along with shrimp and hard clams, hard blue crabs and sea basses contributed a considerable amount to the total landings compared to other species between 1994 and 2012. Average landings of shrimp were 807,266 pounds, twice that of hard blue crabs (345,341 pounds) which had the second highest average landings in Onslow County (Table 99).

## **Pamlico County**

Pamlico County is bordered by several major waterbodies including Neuse River, Bay River, and Pamlico Sound. Almost the entire southern hemisphere of this county touches the Neuse River. Around 350 licenses that allow the commercial catch and sale of seafood are issued to Pamlico County residents each year but less than half of these licenses get used. The number of active fishermen living in Pamlico County is variable from year to year ranging from 120 to 174 participants between 2008 and 2012 (Table 100). Close to 80% of the residents that record commercial landings reported more than 50% of their income comes from commercial fishing (Table 100).

In recent years, Pamlico County has had a steady population and recovering workforce. The average and median wages earned by workers in the county have exhibited a variable trend over time as well. The percent of the workforce involved in commercial fishing either full-time or part-time peaked in 2010 at 3.58% but fell to 2.4% in 2012 (Table 101).

From 1994 to 2000, landings in Pamlico County averaged around 10 million pounds per year but dropped considerably in 2001 to 4.9 million pounds. From 2001-2011, average landings remained around 4.9 million pounds until 2012 when landings dropped by over 2 million pounds (Table 102; Figure 19). The number of dealers and trips increased some in the late 90s but overall remained fairly stable between 1994 and 2005. In 2006, the number of dealers and trips dropped considerably and stayed at that level through 2012 (Table 102). Values ranged from \$4.6 million to \$12.5 million.

The mean nominal and inflation-adjusted values per trip peaked in 2008. Values have decreased since then but remained relatively high. The comparatively distant mean and median trip values indicate an inconsistent value of landings per trip (Table 103). The mean and median annual value of landings per fisherman has been variable, with the highest nominal annual landings per fisherman occurring in 2008 (Table 104).

Pots accounted for 55% of the total landings and 33% of the total value in Pamlico County from 1994 to 2012 while trawls accounted for 33% and 56%, respectively. Pots averaged 3.8 million pounds per year with an average value of \$2.7 million. Average annual landings from trawls were 2.4 million pounds and the average value per year was \$4.6 million (Table 105).

Shrimp, hard blue crabs, and summer flounder dominate the landings and value in Pamlico County by species. These three species accounted for 86% of the total landings and 84% of the total value from 1994 to 2012. All three species have average values of above \$1 million per year (Table 106). Hard blue crabs alone make up more than 50% of the total landings but are not the most valuable fishery in this county (Table 106).

## **Pasquotank County**

Pasquotank County is one of the smaller counties in NC and is bordered on its southern end by Pasquotank River and Albemarle Sound (US Census 2014). The number of commercial fishing licenses issued annually to people living in Pasquotank County has remained fairly constant over the last five years hovering around 100 licenses while the number of licenses used has been more sporadic (Table 107). The number of active fishermen between 2008 and 2012 ranged from 49 to 59 participants per year. The number of people each year considering themselves to be full-time fishermen was 63% on average (Table 107).

In recent years, Pasquotank County has had a steady population and slightly declining workforce. The average and median wages earned by workers in the county have exhibited a variable trend over most of the time period, however fell slightly in 2012. The percent of the workforce involved in commercial fishing in either a full-time or part-time capacity was relatively small, at around 0.35% (Table 108).

Landings and value in Pasquotank County have been on a declining trend since 1994. Landings were lowest in 2007 at 766,193 pounds. The lowest value year was in 2006 (\$843,480). In years following 2006 and 2007, landings and value have been relatively consistent (Table 109; Figure 20). This trend can also be seen in the number of trips per year (Table 109). The number of dealers ranged from 5 to 9 between 1994 and 2012 except for 1996 when the number of dealers reached 11 individuals (Table 109).

The mean nominal value per trip peaked in the late 2000s; however median nominal values were highest in 2012. When adjusted for inflation, mean and median values per trip were highest in 1995 (Table 110). The mean and median annual value of landings per fisherman has been variable, with the highest nominal mean value per fisherman occurring in 2009 and the highest median value occurring in 2008 (Table 111).

Pots and gill nets made up the vast majority of the landings and value in Pasquotank County contributing a combined 99% of the total landings and 98% of the total value. Pots had average landings of 2.1 million pounds per year valued around \$1.7 million. Average gill net landings were about a quarter of the pot landings each year and were valued at \$584,265 (Table 112). The two species contributing over 85% of the landings and value in Pasquotank County were hard blue crabs and southern flounder valued around \$1.6 million and \$469,000, respectively (Table 113).

Table 107. Number of licenses issued, licenses used, active participants, and claimed income from commercial fishing for Pasquotank County, 2008–2012. Data are based on physical address of the participant.

Year	Licenses Issued*	Licenses Used	Active Participants	% of Active Participants Claiming More Than 50% of Income from Commercial Fishing
2008	98	56	56	61%

## **Pender County**

Topsail Sound and portions of Stump Sound and Cape Fear River are located in Pender County providing a range of access points for fishermen living in the county. Topsail Sound and the intercoastal waterway separate the majority of Pender County's coastline from the Atlantic Ocean. Over 300 commercial fishing licenses are issued to residents of Pender County each year but only around 150 licenses had commercial landings. On average, 42% of the active fishermen that live in Pender County claim to earn more than 50% of their annual income from commercial fishing (Table 114).

In recent years, Pender County has had a growing population and slightly declining workforce. The average wages earned by workers in the county have exhibited a variable trend over the time period, while median wages have been increasing. The percentage of the workforce involved in commercial fishing in either a full-time or part-time capacity slightly increased each year with 0.74% involved in commercial fishing in 2012 (Table 115).

Landings in Pender County have been very consistent over the last 19 years. Total landings increased slightly in 2009 and remained at that level through 2012. Values were fairly stable from 1994 to 2004 but have been increasing since 2005 (Table 116; Figure 21). Dealer, participant, and trip counts exhibit trends similar to that of landings. The number of dealers was highest in 2009. Participants and trips were highest in 2012 (Table 116).

The mean and median values per trip have remained relatively stable on a nominal and inflation-adjusted basis. Relatively small differences between the median and mean values per trip indicate a lower variation in the landings from a typical fishing trip when compared with other counties (Table 117). The mean and median annual value of landings per fisherman have been variable, however higher landings values occurred in the latter years of the time series (Table 118).

Rod and reel, pots, trawls, and gill nets made up the majority of the total landings and value for Pender County between 1994 and 2012. These four gears made up 86% of the total landings but only 68% of the total value from 1994 to 2012. The "Other Gears" category (29%) made up more of the total value than any other major gear used in North Carolina (Table 119). Fisheries that contributed to these high values in the "Other Gears" category include trolling for king mackerel, gigning for southern flounder, and hand harvest of clams and oysters (Table A26).

Four species contributed 67% of the total landings in Pender County: hard blue crabs, spot, shrimp, and groupers. The top 5 species by value from 1994 to 2012 were groupers, shrimp, hard blue crabs, hard clams, and oysters (Table 120).

## Perquimans County

Perquimans County is one of the smaller coastal counties in eastern North Carolina. This county completely encompasses the Perquimans River and is bordered by Albemarle Sound to the south. The number of licenses allowing the sale of commercial catch by fishermen living in Perquimans County has been increasing over the last five years. Licenses issued have ranged from 62 to 76 between 2008 and 2012. Unlike many of the other coastal counties, around two thirds of the licenses issued get used each year and the portion of active participants claiming to be full-time fishermen is typically over 70% (Table 121).

From 2008 to 2012, Perquimans County has had a steady population and workforce. The average wages earned by workers in the county have exhibited an increasing trend over the time period. The percent of the workforce involved in commercial fishing either full-time or part-time increased slightly almost every year with about 1% involved in commercial fishing in 2012 (Table 122).

Landings and values in Perquimans County have been highly variable over the years (Table 123; Figure 22). Trips and participants were particularly low in 1994 compared to subsequent years resulting in extremely reduced landings and value that year. More than likely these low numbers may be attributed to reduced reporting at the beginning of the trip ticket program. Values peaked in 2002 and 2009 at \$2.4 million. Landings also peaked in those years as well as in 1999 and 2010. Landings in peak years were above 2 million pounds (Table 123; Figure 22).

The mean and median nominal values per trip tended to be higher toward the end of the timeline. Relatively small differences between the median and mean values per trip indicate a lower variation in the landings from a typical fishing trip (Table 124). The mean and median annual values of landings per fisherman have been highly variable, matching the trend of variability in the value of overall landings (Table 125).

Pots and gill nets made up 99% of the total landings and value in Perquimans County from 1994 to 2012. Pots alone contributed 83% of the landings and 82% of the value. Pots were valued at \$1.2 million per year on average (Table 126).

Hard blue crabs and southern flounder were the vast majority of the species landed in Perquimans County with 87% of the total landings and 90% of the total value between 1994 and 2012. These two species are the most commonly caught species in the top gears reported in this county (Table 127).

## Tyrrell County

The economy in Tyrrell County during the 18<sup>th</sup> and 19<sup>th</sup> centuries was primarily based on small farming operations and commercial fishing throughout the Albemarle Sound and Alligator River (NorthCarolinahistory.org 2014). Commercial fishing is still the chosen profession of several people residing in Tyrrell County, more than 80% of them fishing on a full-time basis (Table 128).

From 2008–2012, Tyrrell County had a steady population and workforce. The average and median wages earned by workers in the county remained relatively flat over the time period. The percentage of the workforce involved in commercial fishing in either a full-time or part-time capacity decreased slightly almost every year; however remained around 3% of the total workforce for the county (Table 129).

Landings in Tyrrell County have been fairly consistent from 1994 to 2012 except for an irregular spike in landings in 1996 reaching over 7 million pounds due to a large increase in hard blue crab landings (Tables 130 and A47; Figure 23). Value followed a similar pattern but when landings became very consistent between 2008 and 2012, values were mostly declining during those years. Dealer numbers from 1994 to 2012 have fluctuated around an average of 12 active dealers per year (Table 130).

The mean and median nominal values per trip tended to be higher toward the end of the timeline. Relatively small differences between the median and mean values per trip indicate a lower variation in the landings from a typical fishing trip (Table 131). The mean and median annual values per fisherman were highest in 2008 and 2009 on both a nominal and inflation adjusted basis (Table 132).

Pots contributed 92% of the total landings and 91% of the total value in Tyrrell County from 1994 to 2012 averaging 3.9 million pounds valued at over \$2.6 million per year (Table 133). The next most common gear was gill nets. As expected, based on the primary gears used, hard blue crabs, peeler crabs, and southern flounder made up 93% of the total landings and 94% of the total value in this county. Hard blue crabs contributing the vast majority (Table 134).

Table 128. Number of licenses issued, licenses used, active participants, and claimed income from commercial fishing for Tyrrell County, 2008–2012. Data are based on physical address of the participant.

Year	Licenses Issued*	Licenses Used	Active Participants	% of Active Participants Claiming More Than 50% of Income from Commercial Fishing
2008	106	68	62	87%
2009	109	78	70	81%
2010	110	79	70	87%
2011	113	68	62	89%
2012	107	71	62	82%

## Washington County

Washington County, centrally located within the coastal region of the state, is bordered by Roanoke River and a large portion of Albemarle Sound. Over the last five years, on average, 26 commercial fishing licenses are issued to residents of Washington County each year. The number of licenses getting used and the number of people actively fishing has been variable over time but has been lower in 2011 and 2012 than in previous years. The proportion of active fishermen claiming full-time status has been increasing in recent years (Table 135).

From 2008–2012, Washington County has had a slightly declining population and workforce. The average and median wages earned by workers in the county remained relatively flat over the time period. The percent of the workforce involved in full-time or part-time commercial fishing has fluctuated, but remained relatively low at around 0.2% (Table 136).

Landings and value have been highly variable between 1994 and 2012 and have been consistently declining since 2008 (Table 137; Figure 24). In 2011, there were no landings in Washington County. In 2012, only one trip was recorded with landings sold in the county. Due to low participation in some years, some annual data were confidential (Table 137).

The mean and median values per trip were highly variable, with the end of the time series containing confidential landings data. Mean and median values per trip tended to exhibit similar trends and relatively small differences between the measurements indicate a general lower variation in the landings per trip (Table 138). Mean and median annual values per fisherman were highly variable on both a nominal and inflation adjusted basis (Table 139).

Pots accounted for the vast majority of the landings (96% of the total pounds) and value (94% of the total value) in Washington County. On average, 977 trips were taken each year using pots with landings averaging 775,181 pounds valued at \$655,889 (Table 140).

Hard blue crabs were 96% of the total landings by species in Washington County and 93% of the total value. Other species caught in this county, though minimal in comparison to the total, were southern flounder, peeler blue crab, Spanish mackerel, and striped bass (Table 141).

## DISCUSSION

Over 8,500 commercial fishing licenses are issued by the NCDMF each year, however less than half of these licenses get used. From 2008 to 2012, the percentage of licenses getting used each year has been declining. Landings in North Carolina account for a large portion of the total landings in the South Atlantic. The South Atlantic region consists of North Carolina, South Carolina, Georgia, and the Atlantic side of Florida. In 2012, North Carolina contributed 52% of the total landings and 43% of the total value in the South Atlantic. Hard blue crabs are the most valuable fishery in North Carolina and the state had the fourth highest landings of blue crab in the United States in 2012 (NMFS 2013). Hard blue crabs, shrimp, and southern flounder were the most commonly harvested species in the state. Pots and gill nets were the most commonly used gear type in the state which coincides directly with the most commonly landed species. The total landings for the state of North Carolina has varied widely from 1972 to 2012 for many reasons such as variations in species recruitment years, shifts in total fishing effort, changes or increases in management measures, weather events, and changes in socioeconomic aspects of individual fisheries. Statewide landings and value have slowly been declining since 1981 (Figure 2). This declining trend is also common among many of the coastal fishing counties within the state. Eight of the nineteen counties discussed in this report exhibited overall declining trends from 1994 to 2012 (Beaufort, Brunswick, Chowan, Dare, Hyde, New Hanover, Pamlico, and Pasquotank). Several factors may be contributing to declines in the ex-vessel values of landings at the state and/or county level including competition with imports, increasing regulations, declining fish and shellfish populations, as well as economic hardships within the state and the nation.

Five of the counties showed either a steady increase in landings over time or patterns of several peak years with drastic increases followed by consistent or declining landings in recent years (Camden, Currituck, Pender, Perquimans, and Washington). Carteret County landings were largely affected by the menhaden reduction fishery but once this fishery ended in 2005, overall county landings remained stable through 2012. The other five counties showed fairly consistent landings over the 19-year time frame covered in this report (Bertie, Craven, Hertford, Onslow, and Tyrrell).

Hard blue crabs were a major species for almost all of the coastal fishing counties. The only county in which hard blue crabs were not a significant source of ex-vessel value or did not contribute considerably to landings was Hertford. Hertford County had a large pound net fishery for river herring until 2007 when a statewide moratorium was placed on this species to protect the declining stock. Anadromous and brackish water species (shads, river herring, striped bass, yellow perch, catfishes, etc.) were among the top 10 species in counties in the Albemarle Sound area while species from the snapper-grouper complex were more commonly landed in counties located in the southern part of the state. Shrimp landings, second only to hard blue crabs for total ex-vessel value statewide, were noteworthy for Dare County south to the South Carolina border.

Comparison across gear types showed that pots, gill nets, and trawls were the most used gears in many of the coastal fishing counties and typically had the highest landings and ex-vessel values. The two counties that did not fit this trend were Carteret County, which had a considerable amount of landings from purse seines, and Hertford County, whose major gear

type was pound nets. However, if the landings from purse seines are excluded from Carteret County, landings from pot, gill nets, and trawls would account for the majority in that county. In several counties, the “Other Gears” category accounted for more of the total value than any major gear type. In these situations, much of the landings and values were from trolling for king mackerel, gigging for southern flounder, and hand harvest of clams and oysters. Many times trolling gear is lumped with rod and reel landings into a gear category called handlines. This method is used in many of the stock assessments completed through the Southeast Data Assessment and Review (SEDAR) process for species whose primary harvest gear is rod and reel or trolling such as snappers, groupers, and mackerels. In future versions of this report, trolling should be lumped with rod and reel.

The commercial fishing industry is a very important economic component to several coastal communities in North Carolina. The commercial fishing-harvesting sector supported approximately 3,500 jobs in 2012 and produced almost \$51 million in income, with an economic impact just shy of \$116 million (Table 7). The impacts of the commercial fishing industry are not uniform across the coastal counties, with the greatest impacts occurring in Dare, Carteret, Hyde, and Onslow counties. The counties least effected by commercial fishing were Bertie, Chowan, Hertford, and Washington counties.

The data in this report also indicate that commercial fishermen compose a small portion of the total workforce for some coastal counties and for the state as a whole but may make up a noteworthy part of the workforce for others. Hyde County had the largest percentage of the workforce involved in commercial fishing in a full time or part time capacity in 2012 with almost 6% while Carteret, Dare, Pamlico, and Tyrrell counties had more than 2% of their workforce involved in commercial fishing. No other coastal fishing county had greater than 2% of their workforce composed of commercial fishermen.

In North Carolina, a number of studies have been conducted by the NCDMF to examine the socioeconomic aspects of the commercial fishing-harvesting sector. Statewide, the vast majority of commercial fishermen are male and Caucasian. Also, most commercial fishermen have a high school education or higher and a household income of \$30,000 to \$50,000 (Crosson 2007, 2009, 2010; Hadley and Weigand 2014). The data in this report as well as survey results from NCDMF studies suggest that there are several issues that may have implications on the livelihood of commercial fishermen in North Carolina including increased regulations, changing markets, higher fuel prices, competition from seafood imported from both out of the state and out of the county, and declining populations for some commercially important species (Crosson 2007, 2009, 2010; Hadley and Weigand 2014). All of these pressures have contributed to the general decline in the number of fishermen recording commercial seafood landings.

## RESEARCH LIMITATIONS

The data within this report only focus on participants that landed and sold their catch between 1994 and 2012. Therefore, changes in the number of participants (i.e., fishermen, dealers) only represent the variation in the number of those reporting landings in North Carolina. Participants that fish but do not sell their catch are not accounted for in this analysis. Likewise, the data presented in this report only reflect the landings that were sold legally to commercial seafood dealers. Landings that were sold illegally as well as catch that was kept for personal consumption were not accounted for in this report and currently cannot be estimated. Some fishermen residing in North Carolina may land their catch in other states. Landings and values in other states by North Carolina fishermen were not included in this report.

The number of licenses by county of residence was only calculated for the last five years of complete trip ticket data (2008–2012) and was based on the current active address of the license holder. The database containing the address history of each participant has some limitations and it was discovered that in some cases when a license holder changed addresses, the change was not captured in the database in a continuous fashion, creating gaps between the end date of the old address and the start date of the new address. The trip ticket landings data were matched to the address data by date of landing. In cases where gaps exist in the address history, landings will not be accurately attributed to the county of the license holder. For this reason, the most current address in the database was assumed to have remained the same over the last five years and that the number of license holders that move across counties in that time period would be minimal.

The economic estimates included in this report solely focus on the harvesting sector of the commercial fishing industry and therefore are an underestimate of the total economic effect that the seafood industry has on the state economy. The economic effects of commercially harvested seafood after sale to the dealer are left out due to limited or total lack of data on how much value is added to the products as they move down the supply chain to the final consumer. Furthermore, if the seafood product leaves the state of North Carolina, it may no longer contribute to the state economy depending on product type. Based on circumstantial observations, in-state and out-of-state markets for seafood products vary greatly by species and time of year. Furthermore, the extent to which imported seafood plays into the supply chain within the state at various points is unknown. This makes modeling of economic impacts of the entire seafood supply chain extremely difficult to perform with adequate certainty.

## RESEARCH RECOMMENDATIONS

The following recommendations are suggested to obtain more accurate data and understanding of the commercial fishing industry and the economic impact to the state of North Carolina:

- Continue to improve the quality of the data in the trip ticket database by determining any possible discrepancies and making sure accurate license numbers are recorded on trip tickets
- Work to improve address history in license database and linkages between license data and trip ticket data
- Develop or obtain more accurate data on seafood processors, wholesalers, and retailers in the state of North Carolina to accurately determine effects to the state
- Research markets and supply chains for the most valuable commercially harvested species
