1.0 EXECUTIVE SUMMARY

The following report summarizes the vegetation establishment and stream stability for Year 4 monitoring for Phase 1 of the Adkin Branch Stream Restoration Project (Site) in Lenoir County, North Carolina.

1.1 Goals and Objectives

The primary goals of the Adkin Branch Stream Restoration Project focus on:

- Restoring a stable dimension, pattern, and profile to Adkin Branch and UT to Adkin Branch (UT)
- Improving water quality
- Decreasing floodwater levels
- Restoring aquatic and riparian habitat
- Implementing best management practices (BMPs) for stormwater quality and retention

These goals will be achieved through the following objectives:

- Reducing sediment input to Adkin Branch by restoring 7,579 linear feet of stream to a stable dimension, pattern, and profile, and establishing a vegetated stream bank, floodplain, and terrace forest. Forest vegetation species were selected by studying a Reference Forest Ecosystem located directly upstream of the Project and reviewing species listed in *Classification of the Natural Communities of North Carolina: Third Approximation* (Schafale and Weakley 1990) for a Coastal Plain Levee Forest. A total of 31.92 acres of the conservation easement were reforested.
- Promoting floodwater attenuation and decreasing floodwater levels by excavating a gently sloping floodplain that begins at the bankfull discharge elevation and slopes up to the terrace elevation, in addition to increasing roughness in the floodplain by establishing a vegetated riparian buffer.
- Improving aquatic habitat by enhancing stream bed variability (ripple-pool sequence), and introducing woody debris in the form of rootwads, log vanes, and log sills. A ripple-pool sequence and woody debris structures will provide places for forage, cover, and reproduction for fauna and flora.
- Improving terrestrial habitat by restoring a forested riparian corridor through a highly urbanized environment, which has historically experienced vegetation maintenance and forest segmentation. This corridor will provide a diversity of habitats such as mature forest, early successional forest, riparian wetlands and uplands.
- Reducing nonpoint source pollution associated with urban land uses (i.e. maintained ball fields, roadways, residential communities, etc.) by providing a vegetated riparian buffer adjacent to streams to treat surface runoff. Reforestation of the Project resulted in a total of 1,171,272 sq. ft. (26.89 acres) of Neuse River Riparian Buffers (area within 200' of top of bank of channel that is at least 50' wide).
- Improving water quality by creating 0.69 acres of riparian stormwater wetland adjacent to the UT, implementing six (6) sand filter device BMPs along Adkin Branch for

stormwater runoff to retain sediments and nutrients prior to entering Adkin Branch, and removing creosote timber retaining walls throughout the project.

1.2 Vegetation

Stream Vegetation Success Criteria

According to 15A NCAC 02B .0295 Mitigation Program Requirements for Protection and Maintenance of Riparian Buffers vegetation will be considered successful for stream mitigation credit if at least 260 stems/acre (trees and shrubs), both, volunteer and planted, are surviving at the end of five years. The interim measure of vegetative success for the site will be the survival of at least 320 3-year old stems per acre at the end of year three of the monitoring period and 280 4-year old stems per acre at the end of year four of the monitoring period (USACE et al. 2003).

Riparian Buffer Vegetation Success Criteria

Vegetation monitoring will be considered successful for riparian buffer mitigation credit if at least 320 native planted hardwood stems/acre (trees only) are surviving at the end of year five. Planted vegetation must include a minimum of at least two planted native hardwood tree species. There is no interim measure of vegetative success for riparian buffers.

Monitoring Results

Year 1 (2011)

In general, vegetation within the Site was doing poorly in Year 1 (2011) and many of the planted trees had died over the summer of 2011 as the result of extreme hot, dry conditions followed by Hurricane Irene. Due to poor planted stem survivability in Year 1, vegetation warranty Site assessments were conducted in September 2011 by EEP and Axiom Environmental, Inc. (Axiom) as described in the EEP letter to Fluvial Solutions, Inc. dated January 25, 2012 (Appendix C). The results of the Site assessment required Fluvial Solutions, Inc. to replant bare root seedlings in four areas as depicted on the Supplemental Planting Map provided in Appendix B. A total of 11 ball and burlap trees were also replanted. Fluvial Solutions, Inc. contracted Bruton Natural Systems, Inc. to replant the Site. Replanting was completed on March 8, 2012. The list of species replanted at the Site is provided in Tables C4 and C5 (Appendix C).

Year 2 (2012)

Despite replanting the Site in 2012, planted tree growth within the Site remained poor during the Year 2 (2012) monitoring period. Based on the number of stems counted, average densities were measured at 491 planted stems per acre (excluding livestakes) surviving. The dominant species identified at the Site were planted stems of silky dogwood (*Cornus amomum*), river birch (*Betula nigra*), and southern red oak (*Quercus falcata*). Fourteen of the twenty-two individual vegetation plots met success criteria when counting planted stems alone. Three plots (Plots 9, 10, and 11) did not meet success criteria based on planted stems alone; however, when including appropriate naturally recruited stems of hickory (*Carya* sp.), these plots were well-above success criteria. In addition, a large pecan tree fell within Plot 11 contributing to numerous missing planted stems. Lespedeza is dominating the floodplain in the vicinity of Plots 7 and 8, making it difficult for planted stems to survive. Several small areas along stream benches were

characterized by exposed soils with little vegetation in Year 1; however, herbaceous vegetation was beginning to fill in these areas. Several small areas of invasive species occurred within the Site including Chinese privet, Johnson grass, and Japanese honeysuckle. Lespedeza was dominating the left and right floodplain between stations 90+00 and 96+00 and was out-competing planted woody vegetation. It was recommended that an herbicide approved for use in or near aquatic sites be applied to this area to control lespedeza. Plant coverage within the stormwater BMP was greater than 95 percent.

Year 3 (2013)

Based on the number of stems counted, average densities were measured at 495 planted stems per acre (excluding livestakes) surviving in Year 3 (2013). The dominant species identified at the Site were planted stems of silky dogwood (*Cornus amomum*), river birch (*Betula nigra*), and southern red oak (*Quercus falcata*).

Fifteen of the twenty-two individual vegetation plots met success criteria when counting planted stems alone. Plot 9 was not sampled because it was destroyed by construction equipment during stream repair efforts in July 2013. The site received supplemental planting in areas with low stem densities and those areas disturbed by construction activities in 2013. The areas that were replanted include the staging and stockpile locations, haul road and any other area within the easement that were impacted by construction equipment. Three plots (Plots 6, 10, and 11) did not meet success criteria based on planted stems alone; however, when including appropriate naturally recruited stems of hickory (*Carya sp.*) and American elm (*Ulmus americana*), these plots exceeded success criteria. Herbaceous vegetation has continued to fill in stream bench areas that were bare in Year 1 (2011). Planted tree growth within the Site, in general, is poor. Several small areas of invasive species occurred within the Site including Chinese privet, Johnson grass, lespedeza, and Japanese honeysuckle as depicted on the CCPV (Appendix B).

The plant coverage within the stormwater BMP was greater than 95 percent.

Year 4 (2014)

Based on the number of stems counted, average densities were measured at 498 planted stems per acre (excluding livestakes) surviving in Year 4 (2014). The dominant species identified at the Site were planted stems of silky dogwood (*Cornus amomum*), river birch (*Betula nigra*), and southern red oak (*Quercus falcata*).

Sixteen of the twenty-two individual vegetation plots met success criteria when counting planted stems alone. Vegetation in Plot 9 was damaged by construction equipment during stream repair efforts in July-September 2013; several planted stems have resprouted but overall the area around this plot is sparse. Five plots (Plots 7, 10, 11, 16, and 18) didn't meet success criteria based on planted stems alone; however, when including appropriate naturally recruited stems of hickory (*Carya sp.*) and American elm (*Ulmus americana*), these plots exceeded success criteria.

The site received supplemental planting in areas disturbed by construction activities in 2013. The areas that were replanted include the staging and stockpile locations, haul road and any other area within the easement that were impacted by construction equipment. Supplemental planting with 1060 containerized trees (1-gallon and 3-gallon) and 3000 livestock occurred in early 2014 as found in tables C1-C3. The majority of containerized trees are doing well. Supplemental planting can be seen in Appendix C.

Several areas of invasive species occur within the Site including Chinese privet, Johnson grass, lespedeza, and Japanese honeysuckle as depicted in the CCPV (Figures 2.6-2.7 and 2.9-2.11). Invasive species were treated in March 2014. EEP is currently contracted with a firm to manage *Ailanthus altissima*, *Ligustrum sinensis*, *Ligustrum japonica*, *Melia azedarach*, *Sorghum halepense*, and *Wysteria sp.*.

Currently plant coverage within the stormwater BMP is greater than 95 percent.

1.3 Stream Stability

Year 1 (2011)

Year 1 monitoring surveys along Adkin Branch and its UT occurred in October, 2011.

Reach 1: Significant stream bed scour was observed from station 41+00 to 46+00. This scour likely occurred during the storm events associated with Hurricane Irene in late August, 2011. Several of the existing pools deepened and/or lengthened as a result of the storm events, but the log structures maintained grade control and the overall stability of the channel was not compromised. Only minor shifting of pools and riffles was observed throughout the remainder of the profile, which is expected in a sand bed system. The majority of stream banks and structures throughout the project were stable and functioning as intended. There was no evidence of trends toward significant change in channel pattern. Cross sectional data indicated that the channel width to depth ratio was lowering as the channel matured. This change is expected as detailed in the proposed success criteria from the Baseline Monitoring Document (NCDENR, 2011).

Reach 2: Significant stream bed scour was observed from station 68+71 to 74+64. Based on an overall visual assessment of the channel, Reach 2 appeared to contain the majority of the problem areas on the Site. Twelve riffle segments were noted as unstable in Reach 2 as a result of the scour from large storm events, most notably, events associated with Hurricane Irene. Twelve bank segments were noted as eroding in Reach 2, due to a lack of vegetation along the stream banks. One log cross vane had been compromised in Reach 2 as a result of stream bank erosion around the vane arm. Six log structures were experiencing erosion on greater than 15 percent of the streambanks within their extent of influence and three log structures exhibited minor erosion around the vane arms. A Repair Plan was developed to correct these problem areas, which included the use of soil lifts, bank grading, and erosion control matting.

The soil lifts that were installed in January and February, 2011 are stable with well-established willow cuttings along the stream banks.

Reach 3: Reach 3 was performing as expected.

Crest gauges installed on-site were inspected on 26 October, 2011. Crest Gauge 2 near station 75+25 was damaged during Hurricane Irene. The remaining crest gauges revealed that a bankfull event occurred at least once during 2011 (Table 13). Additional overbank evidence included debris lines, and vegetation bent in the downstream direction.

Year 2 (2012)

Year 2 monitoring surveys occurred in October and November, 2012.

Reach 1: Reach 1 experienced little change from Year 1 except between stations 39+00 to 41+00 where the pools became deeper and longer. Log structures were stable through this section and continued to maintain grade control.

Reach 2: The profile along Reach 2 provides evidence of the fluctuating nature of a sand bed system. Some pools became deeper and longer (station 65+00 to 69+00) while others filled in and shortened (station 82+50 to 86+00). Overall, Reach 2 was somewhat unstable due to erosion along approximately 45 percent of the stream banks within the Reach. Erosion was attributed to a lack of vegetation and several large storm events, including Hurricane Irene, that have resulted in severe shear stress along the exposed sandy banks. A Repair Plan was developed to correct the eroded stream banks which included the use of soil lifts, bank grading, and erosion control matting. The Repair Plan was implemented in the Spring/Summer of 2013. Fluctuation in channel bed features is expected to continue throughout the monitoring period; however, the overall stream reach should stabilize once woody vegetation establishes along the stream banks. A beaver dam was observed at Station 69+60 and appears to have formed on top of rip rap that was placed in the channel by local residents. Rip rap was also observed in the channel near station 81+25. The soil lifts that were installed in January and February, 2011 are stable with well-established willow cuttings along the stream banks.

Reach 3: Reach 3 experienced aggradation between Stations 10+00 and 12+35 due to dense herbaceous vegetation forming in the channel and trapping sediment. However, the stream remains stable and flood waters are accessing the adjacent stormwater wetlands as intended. Only minor shifting of pools and riffles was observed throughout the remainder of the profile, which is expected in a sand bed system. The majority of stream banks and structures throughout the project were stable and functioning as intended. There was no evidence of trends toward significant change in channel pattern. Cross sectional data indicated that the channel width to depth ratio was lowering as the channel matures.

Crest Gauge 2 near station 75+25 was damaged during Hurricane Irene, but was reinstalled on November 8, 2012. The remaining crest gauges revealed that a bankfull event occurred at least

once during 2012 (Table 13). Additional overbank evidence includes debris lines, and vegetation bent in the downstream direction. Evidence of bankfull events can be found in Appendix E.

Year 3 (2013)

Year 3 monitoring surveys occurred in July and August, 2013.

Reach 1: Reach 1 experienced little change from Year 2 with the log structures remaining stable through this section and continuing to maintain grade control.

Reach 2: The profile along Reach 2 provides evidence of the fluctuating nature of a sand bed system. Some pools became deeper and longer while others filled in and shortened. In general, the unstable sections of Reach 2 that were documented in the Year 2 Monitoring Report were been repaired as part of construction activities completed in September of 2013. The majority of the plans consisted of installed soil lifts along eroded banks, which are now shown in the CCPV. Fluctuation in channel bed features is expected to continue throughout the monitoring period, but the overall stream reach should stabilize once woody vegetation establishes along the stream banks.

The Year 2 monitoring report discussed various bank reaches that exhibited different levels of erosion. The majority of the eroded banks were repaired during the Hurricane Irene repairs that were completed in September of 2013. The eroding banks have been stabilized through bank grading with matting or with the installation of soil lifts. All repaired sections were planted with live stakes and should remain stable as long as the newly planted vegetation continues to thrive. Some moderate scour has developed behind the vane arm of the log cross vane at station 64+80 which can be seen in the cross section 6 data. However, multiple black willow trees are continuing to grow and stabilize the bank around the scour which should aid in the long term stability of the right bank. It is recommended that observation of this section continues throughout the upcoming monitoring periods to determine whether the condition necessitates repair in the future. Cross section 7 displayed changes in geometry due to the installation of soil lifts as part of the Hurricane Irene repair plan. The repaired banks have been restored to the geometry recorded in the baseline report.

Sandfilter BMP #6 was taken offline and filled during the Hurricane Irene repairs. The BMP was planted as a part of 2014 supplemental planting. The remaining sandfilter BMPs received maintenance mowing in 2014.

Reach 3: Reach 3 experienced some aggradation from station 10+50 to 11+75 and deepening of pools from approximately station 22+00 to station 25+00. However, the stream remains stable and flood waters are accessing the adjacent stormwater wetlands as intended.

Only minor shifting of pools and riffles was observed throughout the remainder of the profile, which is expected in a sand bed system. The majority of stream banks and structures throughout

the project are stable and functioning as intended. There was no evidence of trends toward significant change in channel pattern. Cross-sectional data indicated that the channel width to depth ratio is lowering as the channel matures.

EEP contracted with US Department of Agriculture (USDA) Animal and Plant Health Inspection Service (APHIS) to control beavers on site in February of 2013. Eight beaver dams were observed within the project reach and EEP contacted US Department of Agriculture in February of 2013 to begin removing the dams. After removal of the dams, additional erosion was observed, and these areas were added to the repair plans which were conducted in summer 2013.

The site experienced at least one bankfull flow in July, 2013. Additional overbank evidence includes debris lines, and vegetation bent in the downstream direction.

Year 4 (2014)

Year 4 monitoring surveys occurred in April 2014.

Reach 1: Reach 1 profile experienced minor scouring near station 52+00, however this change in profile depth is expected in a sand bed system. All structures appear to be maintaining grade control. An area around station 53+00 is experiencing major erosion along the right bank and may require repairs if erosion continues. Moderate bank erosion is also occurring in three areas downstream of station 58+00. Four areas between stations 42+00 and 47+00 are experiencing minor erosion along the banks (Figure 3.21). Bank widening is also occurring between station 55+50 and 58+00 (Figure 3.27). Areas of minor bank erosion and bank widening should be watched closely in future monitoring years.

A beaver dam was observed near Station 40+80 on April 4, 2014. EEP contacted APHIS and the dam was removed by chainsaw on April 14, 2014. The area where the dam was removed should be watched for signs of stream instability. Photos of the beaver dam can be seen in Figures 3.25 and 3.26.

Reach 2: The profile of Reach 2 continues to fluctuate as is expected with a sand bed system. Several of the pools have scoured while others have filled. In general, the changes to the profile are not significant and similar changes are expected to continue throughout the monitoring period.

Unstable sections repaired during September 2013 can be seen in the CCPV and are functioning as intended. Vegetation along the banks continues to mature and aid in bank stabilization. Soil lifts installed during the 2013 repairs can be seen in the cross section photos (Figure 4.7, 4.8, 4.10, 4.12) and are also contributing to the overall stabilization of banks. Moderate scour observed during Year 3 monitoring at Cross Section 6 continues to be an area of concern for the stream (Figure 3.23). Cross Section survey data shows the area to the right of the log vane continuing to scour. Woody vegetation growing on the banks is slowing the scouring, however, the area should still be closely observed during monitoring. Similar erosion is occurring at the

right of the log vane at Cross Section 8 (Figure 3.24). Notably less vegetation is present in this area and therefore this area should be watched closely as monitoring continues. The geometry of Cross Section 7 remains similar to Year 3 monitoring after soil lifts were installed in 2013. The soil lifts are performing as intended and are aiding in the stabilization of this section of the channel. Cross sections 9, 10 and 11 revealed notable increase in bankfull width and area due to stream bank erosion when surveyed on 4/1/2014. A Major rain event occurred on 12/24/2013 accumulating 2.05 inches of precipitation, which coupled with sandy soils and sparse vegetation likely led to the bank erosion. Cross sections were re-surveyed 8/9/2014 and showed minimal change since the April surveys. Another rain event on 7/4/2014 totaled 4.17 inches of rain, however, this storm did not affect channel dimension.

Severe erosion is also occurring in the channels entering the stream below Cross Section 11 from the stormwater BMP (Figure 3.27-3.29). EEP installed live stakes in this area and it should be monitored to see if the plantings are having a significant impact on bank and channel. Other areas experiencing bank erosion and widening can be seen in the CCPV.

Reach 3: Reach 3 experienced some minor scouring and filling of the stream bed at the upstream end of the reach. Most of the changes occur between section 10+00 and 11+75, as observed at Cross Section 13. The channel profile shows no significant changes through the majority of the reach (Station 11+75 through 21+00. Cross Sections 14, 16, and 17 do not show signs of serious erosion and have retained similar geometry to the previous monitoring year. Cross Section 15 was not surveyed due to a fallen tree over the channel.

No bank erosion appears to be occurring in Reach 3. Reach 3 observations can be seen in the CCPV and in Figure 3.30.

The site experienced at least one bankfull flow in March 2014 (Table 13). Additional overbank evidence was seen in debris lines and bent vegetation in the downstream direction. Evidence of bankfull events can be seen in Appendix E.

1.4 Wetlands

No wetland monitoring areas were established for this project report.

1.5 Note

Summary information/data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the Baseline Monitoring Report (formerly Mitigation Plan) and in the Mitigation Plan (formerly the Restoration Plan) documents available on EEP's website. All raw data supporting the tables and figures in the appendices is available from EEP upon request. Credit Calculation Figures are provided in Appendix F.

EEP is currently evaluating feasibility and benefits of implementing repairs and supplemental planting to eroding areas of concern.

2.0 METHODOLOGY

2.1 Vegetation

Vegetation was measured at twenty-two sample vegetation plots (10-meter by 10-meter) within the Site in July 2014 for Year 4 (2014) monitoring per guidelines established in *CVS-EEP Protocol for Recording Vegetation, Version 4.2* (Lee et al. 2008). The taxonomic standard for vegetation used for this document was *Flora of the Carolinas, Virginia, Georgia, and Surrounding Areas* (Weakley 2006). Vegetation plots are permanently monumented with 4-foot metal garden posts at each corner. In each sample plot, vegetation parameters monitored included species composition and species density. Visual observations of the percent cover of shrub and herbaceous species were documented by photograph. Photographs and vegetation plot information can be found in Appendices B and C.

2.2 Streams

The Year 4 (2014) Monitoring survey was completed using a Total Station. Each cross section was marked with two rebar monuments at their beginning and ending points. The rebar has been located vertically and horizontally in NAD 83-State Plane. Surveying these monuments throughout the Site ensured proper orientation. The survey data was imported into MicroStation for verification. The longitudinal stationing was developed from total station data and compared with previous year's data to ensure consistent beginning and ending points. RIVERMorph was used to analyze the profile and cross section data. Tables and figures were created using Microsoft Excel. The channel is entirely a sand bed system; therefore, a pebble count was not conducted.

2.3 Wetlands

No wetland monitoring areas were established for this project report.

2.4 Sand Filter BMPs and Stormwater Wetlands

Sand filter BMP devices will be monitored and maintained periodically, as necessary, to ensure the life of the devices. The City of Kinston has agreed to provide maintenance for the sand filter BMP devices for the life of the BMPs (30 years). A maintenance guideline manual was provided to the City of Kinston by EEP.

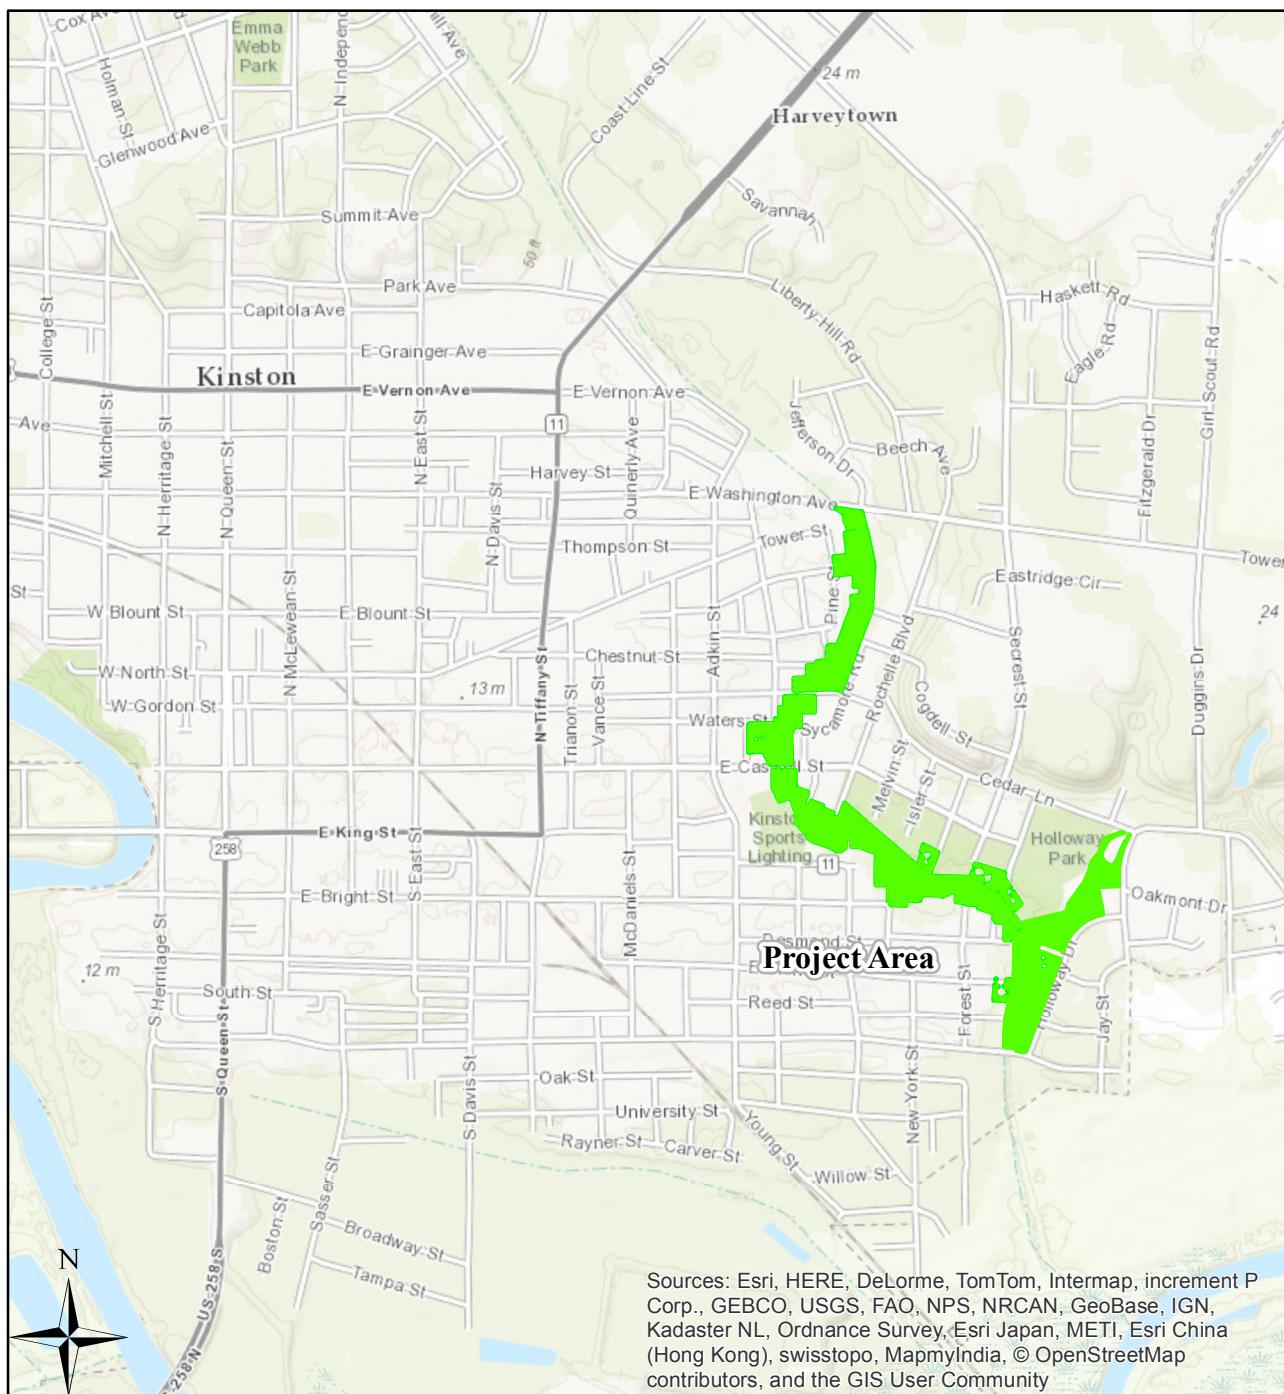

There is no maintenance required on the stormwater wetland. Plant coverage within the stormwater wetlands should be assessed and documented each growing season. If a minimum of 70 percent coverage is not achieved after the second growing season, supplemental planting should be completed. Plant coverage of 90 to 95 percent is desirable.

Project Location and Directions

The Project is located on the southeast side of the City of Kinston, in Lenoir County, North Carolina and includes Adkin Branch and an unnamed tributary (UT) to Adkin Branch (Figure 1, Appendix A). Phase I of the Project begins at Washington Ave. and ends at Lincoln Street.

Directions to the Site:

- From Raleigh, North Carolina take I-40 east for approximately 6.5 miles to US Highway 70 east.
- Take US 70 east for approximately 68.5 miles to NC Highways 11 and 55.
- Take a left turn and travel northeast on NC 11/55 through Kinston for 2.6 miles to the intersection with Adkin Branch.
- The project study area is southeast of NC 11/55.

The subject project is an environmental restoration site of the NCDENR Ecosystem Enhancement Program (EEP) and is encompassed by a recorded conservation easement, but is bordered by land under private ownership. Accessing the site may require traversing areas near or along the easement boundary and therefore access by the general public is not permitted. Access by authorized personnel of state and federal agencies or their designees/contractors involved in the development, oversight and stewardship of the restoration site is permitted within the terms and timeframes of their defined roles. Any intended site visitation or activity by any person outside of these previously sanctioned roles and activities requires prior coordination with EEP.

Table 6. Vegetation Condition Assessment

Table 6
Adkin Branch Restoration Site (EEP Project 7)

33

Vegetation Condition Assessment

| Vegetation Category | Definitions | Mapping Threshold | CCPV Depiction | Number of Polygons | Combined Acreage | % of Planted Acreage |
|--|---|-----------------------|---|--------------------|------------------|----------------------|
| 1. Bare Areas | A few small areas along stream benches throughout the Site have exposed soils with very little vegetative cover. | All areas were mapped | See legend on CCPV (includes thin grass, no grass, and minor wash areas). | 10 | 0.02 | 0.1% |
| 2. Low Stem Density Areas | Stem densities throughout the Site are low due to death of planted seedlings as the result of extreme dry, hot temperatures over the summer and subsequently Hurricane Irene. | All areas were mapped | See legend on CCPV | 6 | 0.18 | 0.5% |
| | | | Total | 16 | 1212.00 | 3672.7% |
| 3. Areas of Poor Growth Rates or Vigor | Vegetation growth throughout the Site in general is poor. | None | NA | 0 | 0.00 | 0.0% |
| | | | Cumulative Total | 16 | 0.20 | 0.6% |

| Vegetation Category | Definitions | Mapping Threshold | CCPV Depiction | Number of Polygons | Combined Acreage | % of Easement Acreage |
|---|--|-------------------|----------------|--------------------|------------------|-----------------------|
| 4. Invasive Areas of Concern ⁴ | Several small areas of invasives including Chinese privet, Johnson grass, lespediza, and Japanese honeysuckle. | 0.02 | NA | 7 | 3.32 | 8.2% |
| 5. Easement Encroachment Areas ⁵ | NA | NA | NA | 0 | 0.00 | 0.0% |

¹ = Enter the planted acreage within the easement. This number is calculated as the easement acreage minus any existing mature tree stands that were not subject to supplemental planting of the understory, the channel acreage, crossings or any other elements not directly planted as part of the project effort.

² = The acreage within the easement boundaries.

³ = Encroachment may occur within or outside of planted areas and will therefore be calculated against the overall easement acreage. In the event a polygon is catalogued into items 1, 2 or 3 in the table and is the result of encroachment, the associated acreage should be tallied in the relevant item (i.e., item 1,2 or 3) as well as a parallel tally in item 5.

⁴ = Invasives may occur in or out of planted areas, but still within the easement and will therefore be calculated against the overall easement acreage. Invasives of concern/interest are those with the potential to directly outcompete native, young, woody stems in the short-term (e.g. monitoring period or shortly thereafter) or affect the community structure for existing, more established tree/shrub stands over timeframes that are slightly longer (e.g. 1-2 decades). The low/moderate concern group are those species that generally do not have this capacity over the timeframes discussed and therefore are not expected to be mapped with regularity, but can be mapped if in the judgement of the observer their coverage, density or distribution is suppressing the viability, density or growth of planted woody stems. Decisions as to whether remediation will be needed are based on the integration of risk factors by EEP such as species present, their coverage, distribution relative to native biomass, and the practicality of treatment. For example, even modest amounts of Kudzu or Japanese Knotweed early in the projects history will warrant control, but potentially large coverages of Microstegium in the herb layer will not likely trigger control because of the limited capacities to impact tree/shrub layers within the herbaceous layer. Those species with the "watch list" designation in gray shade are of particular interest given their extreme risk/threat level for mapping as points where isolated specimens are found, particularly early in a projects monitoring history. However, areas of discreet, dense patches will of course be mapped as polygons. The symbology scheme below was one that was found to be helpful for symbolizing invasives polygons, particularly for situations where the condition for an area is somewhere between isolated specimens and dense, discrete patches. In any case, the point or polygon/area feature can be symbolized to describe things like high or low concern and species can be listed as a map inset, in legend items if the number of species are limited or in the narrative section of the executive summary.

| ----- | |
| Metadata | Description of database file, the report worksheets, and a summary of project(s) and project data. |
| Proj, planted | Each project is listed with its PLANTED stems per acre, for each year. This excludes live stakes. |
| Proj, total stems | Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems. |
| Plots | List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.). |
| Vigor | Frequency distribution of vigor classes for stems for all plots. |
| Vigor by Spp | Frequency distribution of vigor classes listed by species. |
| Damage | List of most frequent damage classes with number of occurrences and percent of total stems impacted by each. |
| Damage by Spp | Damage values tallied by type for each species. |
| Damage by Plot | Damage values tallied by type for each plot. |
| Planted Stems by Plot and Spp | A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded. |
| ALL Stems by Plot and spp | A matrix of the count of total living stems of each species (planted and natural volunteers combined) for each plot; dead and missing stems are excluded. |

January 25, 2012

Mr. Peter Jelenevsky
 Fluvial Solutions, Inc.
 P.O. Box 28749
 Raleigh, NC 27611

Re: Vegetation Warranty Site Assessment Findings
 Adkin Branch Tropical Storm Repairs
 SCO # 05-06561-01B

Mr. Jelenevsky:

As stated in the January 25, 2012 letter from Ed Hajnos, a significant portion the Adkin Branch project site did not meet the vegetation warranty criteria as stated in contract documents. As per SCO contract 05-06561-01B, Special Provision Section 6.0, bare roots were to survive at a rate of 80%. Subsequently, Change Order No.1 allowed the addition of eighty-six (86) Ball and Burlap plantings (at Holloway Park) which are also under the 80% survival rate. The warranty period began 4/1/2011 and will expire 4/1/2012.

Planted vegetation at the Adkin Branch site was assessed in September 2011 by the project design firm's subconsultant, Axiom Environmental, Inc. (Axiom). Data collected during the sampling efforts report significantly higher plant mortality than contractually permissible. Warranty replant numbers are based on the data collected. Field methodology and data are described below.

September 2011 Vegetation Inspection

Twenty-two (22) CVS vegetation plots were established, each 1,076 sq ft (10m x 10m). All planted bare roots present within the plot were counted towards the warranty criteria, including those that were top-dead but were re-sprouting at their base. The spatial location of the 22 CVS plots is shown on the attached Vegetation Inspection Map.

The Ball and Burlap trees planted along the tributary at Holloway Park were also inspected while on site for viability.

Results

In Coastal Plain Levee Forest Planting Zones, 680 stems were required to be planted per acre. In order to satisfy the 80% warranty survival rate, 544 stems per acre are required to survive the warranty period, which is equivalent to 12 living stems per inspection plot.

Restoring... Enhancing... Protecting Our State

North Carolina Ecosystem Enhancement Program, 1652 Mail Service Center, Raleigh, NC 27699-1652 / 919-715-0476 / www.nceep.net

Of the 22 inspection plots, 15 did not meet the 80% survival warranty. A total of twenty-eight (28) of the 86 Ball and Burlap trees have died or appear to be in poor health.

Coastal Plain Levee Forest Planting Zone – CVS Inspection plot results

| Plot | Living bare roots and shrubs | Required stems per plot | Warranty met | Supplemental planting density/acre needed to meet warranty |
|------|------------------------------|-------------------------|--------------|--|
| 1 | 70 | 12 | Yes | None |
| 2 | 12 | 12 | Yes | None |
| 3 | 18 | 12 | Yes | None |
| 4 | 15 | 12 | Yes | None |
| 5 | 15 | 12 | Yes | None |
| 6 | 9 | 12 | No | 131 |
| 7 | 4 | 12 | No | 348 |
| 8 | 4 | 12 | No | 348 |
| 9 | 1 | 12 | No | 479 |
| 10 | 6 | 12 | No | 261 |
| 11 | 4 | 12 | No | 348 |
| 12 | 5 | 12 | No | 305 |
| 13 | 11 | 12 | No | 44 |
| 14 | 1 | 12 | No | 479 |
| 15 | 20 | 12 | Yes | None |
| 16 | 3 | 12 | No | 392 |
| 17 | 8 | 12 | No | 174 |
| 18 | 7 | 12 | No | 218 |
| 19 | 11 | 12 | No | 44 |
| 20 | 11 | 12 | No | 44 |
| 21 | 12 | 12 | Yes | None |
| 22 | 7 | 12 | No | 218 |

Twenty-two (22) inspection plots were evaluated showing the following results. Seven (7) plots met the required minimum survival percentage of 80% and eleven (11) plots did not meet the minimum survival requirement. The remaining four (4) plots had living bare roots and shrubs which were not included in the analysis due to the lack of survival data.

The following table details the results of the inspection plots. The first column lists the plot number, the second column lists the number of living bare roots and shrubs, the third column lists the required stems per plot, the fourth column lists whether the warranty was met, and the fifth column lists the supplemental planting density/acre needed to meet the warranty.

The results show that 15 of the 22 plots did not meet the 80% survival warranty. A total of twenty-eight (28) of the 86 Ball and Burlap trees have died or appear to be in poor health.

The following table details the results of the inspection plots. The first column lists the plot number, the second column lists the number of living bare roots and shrubs, the third column lists the required stems per plot, the fourth column lists whether the warranty was met, and the fifth column lists the supplemental planting density/acre needed to meet the warranty.

Coastal Plain Levee Forest Planting Zone – Warranty Inspection plot results

Twenty (20) warranty inspection plots (non-CVS vegetation data) were established by Axiom, each 1,612 sq feet (25m x 6m). All planted bare roots present within the plot were counted towards the warranty criteria, including those that were top-dead but were re-sprouting at their base. Given 680 stems were planted per acre, 544 per acre were required to survive 1 year, or 20 per plot to meet the 80% warranty. None of the 20 sample plots met the survival criteria (Vegetation Inspection Map attached).

| Plot | Living bare roots and shrubs | Required stems per plot | Warranty met | Supplemental planting density/acre needed to meet warranty |

Supplemental Planting

The table below shows the number of stems needed to be planted in 4 areas. These areas are also depicted on the Supplemental Planting Map (attached). The planting zone for each is Coastal Plain Levee Forest (CPLF). The number of stems needed in each area was calculated by multiplying the average number of stems needed to meet warranty per plot by the acreage of the given area. Areas 1-4 were sectioned off due to similar plant deficiencies or a topographic break and are shown on the attached Supplemental Planting Map. A total of 11 Ball and Burlap trees also need to be replanted to meet the warranty.

Bare Root - Supplemental Planting

| Area | Station (Looking Downstream) | Planting Zone | Average stems/ac needed | Acres | Total plants needed | Approximate stem spacing |
|-------------|--------------------------------------|----------------------|--------------------------------|--------------|----------------------------|---------------------------------|
| Area 1 | Washington St. to East Gordon Street | CPLF | 226 | 6.21 | 1403 | 13 ft |
| Area 2 | East Gordon St to STA 65+20 | CPLF | 333 | 4.97 | 1655 | 11 ft |
| Area 3 | STA 67+65 to STA 81+20 | CPLF | 338 | 6.30 | 2129 | 11 ft |
| Area 4 | STA 81+20 to Lincoln St. | CPLF | 344 | 8.52 | 2931 | 11 ft |
| | | | | 26 | 8,118 | |

Instructions

- The Supplemental Planting effort needs to be coordinated with EEP so we can arrange to be on site.
- All replant materials must conform to the original project specification (dormant season planting, species composition, size, vigor, etc.).
- The Supplemental Planting effort must take place in the dormant season for Lenoir County; November 15th – March 15th
- ATVs and trucks will be permitted to be used during the replant; however, vehicles are to be driven in upland areas only where no bare roots, shrubs or Ball and Burlap trees were planted.
- Dead trees need to be removed from the site.

Although the warranty for this project doesn't expire until April 1, 2012, EEP does not intend to reassess this site for additional warranty compliance. Plants installed during the warranty replant will not themselves have a warranty placed on them. Once Fluvial Solutions, Inc. complies with this replanting, an Article 27 Satisfaction Letter will be awarded.
