RE: Bear Creek (Phillips) Monitoring (DMS Project # 26, Contract #5715)
Final MY5 (2018) Annual Monitoring Report **12-004.17**

Dear Jeff:

Axiom Environmental, Inc. (AXE) is pleased to provide you with three hard copies and a CD of digital files for the Final Bear Creek (Phillips) Annual Monitoring Report. We received your comments via email on November 9, 2018 and have addressed them as follows:

1. The digital data and drawings have been reviewed and DMS had the following comments:
    a. The following data sources are using the wrong geographic coordinate system (GCS_NAD_1983_2011): 2018_Repairs, CrestGauge, CVS Plots, Easement_Poly, Monitoring Crsoos Section, Veg Area of Concern. Please revise to use NAD 1983 State Plane North Carolina (US Feet) per the digital drawing requirements.
    These shapefiles were updated to use the NAD 1983 State Plane North Carolina (US Feet) coordinate system.
    b. Explain the difference between CrossSections and Monitoring Cross Section shapes and why Axiom is showing two different sets of cross-sections.
    The "Monitoring Cross Sections" shapefile was left over from the planning portion of the project and was included in the digital submittal by mistake. It has been removed from the final digital submittal.
    c. Explain what stream_center polylines labeled FID numbers 0, 1, 3 and 4 are and why they are depicted. These are not creditable stream reaches therefore they could add to confusion.
    The stream_center shapefile was exported directly from the AsBuilt Survey.dwg provided by DMS prior to Year 1 (2014) monitoring. Those attributes have been removed from the stream_center shapefile in the final digital submittal.

2. Section 1.0, page 1: In the first paragraph you state that "All fencing is intact and functioning as designed, and easement signage remains visible." DMS recommends revising this based on Axioms' September 27, 2018 monitoring site visit and the associated photos sent to DMS that showed the fence damage at the culvert crossing at the downstream end of Bear Creek Reach 1 as well as the area of easement encroachment at the ford crossing on the upstream portion of the UT where the landowner has removed a section of fencing within the crossing in order to walk cattle to the next pasture. Also add statement(s) to the effect that DMS notified the landowner to repair fencing and stop easement encroachment and the landowner made the necessary repairs to the fence.
    The statement regarding fencing in section 1.0 was revised as follows: "The majority of site fencing is intact with the exception of two small areas. During the remnants of hurricane Florence, an abundance of large woody debris and wrack was pushed against the fence at the crossing on the downstream end of Bear Creek Reach 1. The debris damaged the fence, compromising it in several places. Additionally, an area of easement encroachment was observed just upstream of the crossing on the Unnamed Tributary. The adjacent landowner had removed a section of fencing within the crossing in order to walk cattle to the next pasture. The cattle were walking through a small corner of the

easement. The areas are depicted on Figures 2A-2B (Appendix B) and have been addressed by NCDMS. The landowner has since made necessary repairs to the fence, and the easement encroachment has ceased."

3. Section 2.1: Add information at the end of this section regarding repair work done in April 2018. Suggest language similar to: In April 2018, DMS contracted with River Works, Inc. undertake minor repair work consisting of grading banks and installation of matting in nine (9) erosional areas on Bear Creek Reach 2. The repair work also included the installation of soil stabilizing ground cover and supplemental planting of a total of 350 trees (tublings) in all areas impacted by the repair work. A small number of the 350 tublings were planted in other areas of the site where there was low stem density.
   This language was added to the end of section 2.1.

4. Section 2.2, page 5: Revise the last two paragraphs in this section of the report to break out all Warranty Planting events performed by Carolina Silvics due to stem densities that were below the 400 stem per acre guaranteed survival per contract. These warranty planting events occurred Feb/Mar 2015 (2,300 plants site wide), Feb 2016 (1,150 trees site wide) and Feb 2017 (1,000 sycamore installed sitewide in remaining low-density areas that were wetter than other areas).
   These two paragraphs were combined into one that reads as follows: "Year 1 (2014) vegetation data indicated stem densities below the 400 stems per acre guaranteed survival during year 1 (2014). Per contract, Carolina Silvics conducted a supplemental planting at the Site in February/March 2015 with a total of 2,300 stems planted site-wide. Year 2 (2015) stem counts remained below 400 stems per acre, so an additional site-wide planting of 1,150 trees occurred in February 2016. During year 3 (2016) it was determined that the majority of the site was meeting the 400 stems per acre warranty with the exception of the wetter areas. To address this, an additional 1,000 sycamore (Platanus occidentalis) bare root seedlings were planted during February 2017 within these wetter areas across the Site. Additionally, Poast herbicide (sethoxydim) was applied to fescue via backpack sprayers to reduce competition. Appendix F contains information and mapping for the 2017 supplemental planting as well as the herbicide application log. The fescue treatment appears to have been successful in reducing competition with the newly planted stems; the newly planted stems appear vigorous."

5. Appendix A, Table 2:
   a. Change "Site-Wide Supplemental Planting" to "Warranty Planting".
      This entry was changed.
   b. Change "Supplemental Planting and Herbicide Application" done in February 2017 to "Warranty Planting and Herbicide Application".
      This entry was changed.
   c. Add a row for "Warranty Planting" for February 2016 between MY2 and MY3.
      This row was added.
   d. Add row for "Stream bank Repair" for April 2018 between MY4 and MY5.
      This row was added.
   e. Add a row for "Beaver Management" starting May 2018 to present between MY4 and MY5.
      This row was added.

6. Appendix B:
   a. Figure 2A: Color used for Stream Areas of Concern is too similar to the color used to depict the 2018 Repairs on Figure 2B. Please change.
      The color used for the 2018 Repairs shapefile was changed to green.
   b. Figure 2B: Show damage to fence cause by remnants of Hurricane Florence on crossing at downstream end of Bear Creek Reach 1.
      Callout text was inserted on figure 2B explaining that the fence had been damaged during the remnants of hurricane Florence.

Please let me know if you have any questions or comments regarding any component of this submittal. Thank you for the opportunity to continue to assist the Division of Mitigation Services with this important project.

Sincerely,
AXIOM ENVIRONMENTAL, INC.

Kenan Jernigan
Project Scientist

1 CD containing digital support files

TABLE OF CONTENTS

APPENDICES

1.0 PROJECT SUMMARY

The North Carolina Department of Environmental Quality- Division of Mitigation Services (DMS) has established the Bear Creek (Phillips Site) Restoration Project (Site) located off of Siler City-Glendon Road (SR 1006) in the southwest portion of Chatham County. The Site is encompassed within 14-digit Cataloging Unit 03030003070050 of the Cape Fear River Basin (Figure 1 and Table 4, Appendix A). Land use at the Site, prior to mitigation activities, was primarily comprised of open pasture used for livestock grazing with a few small areas of mixed hardwood forest. Site streams were impaired by historical and current land management practices, which included timber harvesting, pasture conversion, channelization, and livestock grazing. The easement boundary has been marked with standard DMS metal signage, and is fenced with high tensile barbed wire. The majority of site fencing is intact with the exception of two small areas. During the remnants of hurricane Florence, an abundance of large woody debris and wrack was pushed against the fence at the crossing on the downstream end of Bear Creek Reach 1. The debris damaged the fence, compromising it in several places. Additionally, an area of easement encroachment was observed just upstream of the crossing on the Unnamed Tributary. The adjacent landowner had removed a section of fencing within the crossing in order to walk cattle to the next pasture. The cattle were walking through a small corner of the easement. This area is depicted on Figure 2A (Appendix B) and has been addressed by NCDMS. The landowner has since made necessary repairs to the fence, and the easement encroachment has ceased. Completed project activities, reporting history, completion dates, project contacts, and project attributes are summarized in Tables 1-4 (Appendix A). This report (compiled based on the NC Division of Mitigation Services (NCDMS) *Procedural Guidance and Content Requirements for DMS Monitoring Reports* Version 1.5 dated 6/8/12) summarizes data for Year 4 (2017) monitoring.

The Site is located in the *Upper and Middle Rocky River Local Watershed Plan* (LWP) area (http://portal.ncdenr.org/c/document_library/get_file?uuid=bcd905ef-bbfb-42bb-84a4-d69f39fd3b03&groupId=60329). The LWP identified the following major stressors in the watershed: excess nutrient loading from farming and urban runoff, a lack of riparian vegetation, channel modifications, bacterial contamination, and sediment loading from overland runoff and stream bank erosion. Specifically, cattle access to streams and insufficient bank vegetation were identified as prime causes of streambank erosion in the watershed. The LWP identified the Bear Creek Project as a stream restoration opportunity with the potential to improve water quality and habitat within the Upper Rocky River watershed.

The Site's watershed includes Hydrologic Unit Code (HUC) 03030003070050 which was identified as a Targeted Local Watershed in NCDMS's *Cape Fear River Basin Restoration Priorities (RBRP) 2009* (http://portal.ncdenr.org/c/document_library/get_file?uuid=864e82e8-725c-415e-8ed9-c72dfcb55012&groupId=60329) and is identified in the *Upper Rocky River Local Watershed Plan Detailed Assessment and Targeting of Management Report* (http://portal.ncdenr.org/web/eep/lwps?p_p_id=20&p_p_lifecycle=1&p_p_state=exclusive&p_p_mode=view&_20_struts_action=%2Fdocument_library%2Fget_file&_20_folderId=2806346&_20_name=DLFE-57173.pdf).

Site construction resulted in a stable riparian system that will reduce sediment and nutrient loading to Bear Creek while contributing to water quality conditions that support terrestrial and aquatic species identified in the basin. The goals of the Bear Creek Restoration Project address stressors identified in the LWP and include the following.

- Remove harmful nutrients from creek flow,
- Reduce pollution of creeks by removing excess sediment,
- Improve stream bank stability,
- Increase dissolved oxygen concentrations,
- Improve in-stream habitat,

- Restore terrestrial habitat, and
- Improve aesthetics.

The project goals were addressed through the following project objectives.

- Cattle were removed from streams and runoff is filtered through buffer zones. Flood flows are filtered through restored floodplain areas, where flood flow will spread through native vegetation, which will uptake excess nutrients.
- Stream bank erosion, which contributes sediment loads to the creek, will be greatly reduced, if not eliminated in the Site. Eroding stream banks were stabilized by increasing woody root mass on banks and reducing channel incision. Storm flow containing grit and fine sediments is filtered through restored floodplain areas where flow will spread through native vegetation. The spreading flood flows will reduce velocity, allowing sediment to settle out.
- Eroding stream banks were stabilized using bioengineering, natural channel design techniques, and grading to reduce bank angles and bank height.
- In-stream structures promote aeration of water.
- In-stream structures were constructed to improve habitat diversity and trap detritus. Wood structures were incorporated into the stream as part of the restoration design including log drops and rock structures that incorporate woody debris.
- Adjacent buffer and riparian habitats were restored with native vegetation as part of the project. Native vegetation will provide cover and food for terrestrial creatures.
- Native plant species were planted, invasive species were treated, and eroding and unstable areas were stabilized as part of this project.

The Site mitigation plan was completed in June 2011 with the final design and construction plans completed in June 2012 (Table 2, Appendix A). Project construction was completed between April and October 2013. The implemented mitigation is as follows (Figure 2, Appendix B and Table 1, Appendix A).

- 4061 Stream Mitigation Units by:
    - Restoring approximately 4061 linear feet of stream channel through construction of stable channel at the historic floodplain elevation.
- Planting a native woody riparian buffer (at least 50 feet in width) adjacent to restored channels within the Site.
- Protecting the Site in perpetuity with a conservation easement.

Stream Success Criteria

Stream restoration success criteria for the Site are based on the *Stream Mitigation Guidelines* issued in April 2003 by the USACE and NCDWQ. Success criteria for stream restoration will include 1) documentation of two bankfull events, 2) little change in the channel cross-section from as-built conditions, 3) stable longitudinal profile, 4) substrate consistency, and 5) photographic evidence of stability.

Bankfull Events

Two bankfull flow events in separate years must be documented within the 5-year monitoring period. Otherwise, the stream monitoring will continue until two bankfull events have been documented in separate years.

Cross-sections

Riffle cross-sections located on the restoration and enhancement reaches should be stable and should show little change in bankfull area, maximum depth ratio, and width-to-depth ratio. Riffle cross-sections should generally fall within the parameters defined for channels of the appropriate Rosgen stream type. If any

changes do occur, these changes will be evaluated to assess whether the stream channel is showing signs of instability. Indicators of instability include a vertically incising thalweg or eroding channel banks. Changes in the channel that indicate a movement toward stability or enhanced habitat include a decrease in the width-to-depth ratio in meandering channels or an increase in pool depth.

Longitudinal Profile
Longitudinal profile data for the stream reach should show that bedform features are remaining stable. The riffles should be steeper and shallower than the pools, while the pools should be deep with flat water surface slopes. The relative percentage of riffles and pools should not change significantly from the design parameters.

Bed Material Analysis
Substrate materials in restoration reaches should indicate a progression towards or the maintenance of coarser materials in the riffle features and smaller particles in the pool features.

Photo Reference Sites
Photographs will be used to evaluate channel aggradation or degradation, bank erosion, success of riparian vegetation, and effectiveness of erosion control measures subjectively. Lateral photos should not indicate excessive erosion or continuing degradation of the banks. A series of photos over time should indicate successive maturation of riparian vegetation.

Vegetation Success Criteria
Success criteria have been established to verify that the vegetation component supports community elements necessary for forest development. Success criteria for this project includes an average density of 320 planted stems per acre must be surviving in the first three monitoring years. Subsequently, 290 planted stems per acre must be surviving in year 4, and 260 planted stems per acre in year 5.

Summary information/data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in tables and figures within this report's appendices. Narrative background and supporting information formerly found in these reports can be found in the Baseline Monitoring Report (formerly Mitigation Plan) and in the Mitigation Plan (formerly the Restoration Plan) documents available on the DMS website. All raw data supporting the tables and figures in the appendices are available from DMS upon request.

2.0 METHODOLOGY

2.1 Streams
Post-restoration monitoring will be conducted for five years following the completion of construction to evaluate the effectiveness of Site restoration activities. Monitored stream parameters include stream dimension (cross-sections), pattern (longitudinal survey), profile (profile survey), and photographic documentation. Stream survey data can be found in Appendix D.

Bankfull Events
The occurrence of bankfull events within the monitoring period will be documented using a crest gauge and visual observations. The crest gauge was installed along the streambank to record the highest watermark between site visits, and the gauge will be checked each time the Site is visited to determine if a bankfull event has occurred (Figures 2A-2B, Appendix B). Photographs will be used to document the occurrence of debris lines and sediment deposition on the floodplain during monitoring Site visits.

Cross-sections

Ten permanent cross-sections, six riffle and four pool, were established and will be used to evaluate stream dimension; locations are depicted on Figures 2, 2A, and 2B (Appendix B). Because riffle cross-sections are critical in determining bankfull design parameters, the number of riffle cross-sections established outnumber pool cross-sections. Each cross-section is marked on both banks with permanent pins to establish the exact transect location. A common benchmark will be used for cross-section comparisons from year-to-year data. The annual cross-section survey will include points measured at all breaks in slope, including top of bank, bankfull, inner berm, edge of water, and thalweg, if the features are present. Riffle cross-sections will be classified using the Rosgen Stream Classification System.

Year 5 (2018) cross-section data shows little change from as-built conditions. The bank height ratio at cross-section 7 increased to 1.13 during Year 4 (2017), indicating a small amount of down-cutting which can be seen on the left side of the cross-section plot (Appendix D). In a small channel like the Unnamed Tributary, the bank height ratio can be greatly affected by very small changes in thalweg elevation. This cross-section appears to have stabilized during year 5 (2018), with its thalweg elevation the same as the as-built value, causing its bank height ratio to return to 1.0.

Longitudinal Profile

After Site construction, approximately 4100 linear feet of longitudinal profile was completed to document baseline conditions. Longitudinal profile will be resurveyed annually for the duration of the five-year monitoring period. Measurements include thalweg, water surface, bankfull, and top of low bank. Each of these measurements will be taken at the head of each channel unit (e.g., riffle, pool) and at the maximum pool depth. The survey will be tied to a permanent benchmark.

Bed Material Analysis

Pebble counts will be conducted for six permanent riffle cross-sections (100-counts per cross-section) across the Site. Pebble counts will be completed annually during the five year monitoring period to reveal any changes in sediment gradation over time as the stream adjusts to upstream sediment loads.

Photo Reference Sites

Photographs will be used to visually document restoration success for at least five years following construction. Lateral reference photos should show a stable cross-section with no excessive erosion or degradation of the banks. Reference photographs will show both banks at each permanent cross-section. A survey tape pulled across the cross-section will be centered in the bank photographs. The photographer will make every effort to maintain the same area in each photo over time.

Stream Areas of Concern

Two stream areas of concern were observed during monitoring year 5 (2018). They are depicted on Figure 2A in Appendix B. Area of Concern #1 was observed during the previous four monitoring years, and it has remained relatively unchanged. The right bank of the Unnamed Tributary to Bear Creek has failed causing the water to leave the stream channel and scour a new, smaller channel during storm events. Area of Concern #2 consists of bank scour in the inner bend of a pool caused by instream vegetation that has altered the flow path causing undercutting of the stream bank. Both areas have changed little from previous monitoring years, and both appear relatively stable with herbaceous vegetation becoming well-established.

In April 2018, NCDMS contracted with River Works, Inc. undertake minor repair work consisting of grading banks and installation of matting in nine (9) erosional areas on Bear Creek Reach 2. The repair work also included the installation of soil stabilizing ground cover and supplemental planting of a total of 350 trees (tublings) in all areas impacted by the repair work. A small number of the 350 tublings were planted in other areas of the site where there was low stem density.

2.2 Vegetation

After planting was completed, an initial evaluation was performed to verify planting methods were successful and to determine initial species composition and density. Twelve (12) sample vegetation plots (10-meter by 10-meter) were installed and measured within the Site as per guidelines established in *CVS-DMS Protocol for Recording Vegetation, Version 4.2* (Lee et al. 2008). Vegetation plots are permanently monumented with 6-foot metal t-posts at each corner. In each sample plot, vegetation parameters to be monitored include species composition and species density. Visual observations of the percent cover of shrub and herbaceous species will also be documented by photograph. Vegetation plot information can be found in Appendix C.

Year 5 (2018) stem count measurements indicate an average of 435 planted stems per acre (excluding livestakes) across the Site, which is above success criteria for monitoring year 5 (2018). Additionally, all but one individual plot met success criteria. Plot 4 was just one stem shy of the 260 stems per acre threshold; however, when including naturally recruited stems of sycamore (*Platanus occidentalis*), green ash (*Fraxinus pennsylvanica*), and river birch (*Betula nigra*), the plot is well above success criteria.

Shortly after construction was complete, several large rain events caused flooding that scoured the floodplain, leaving it bare. Vegetation has established throughout much of the floodplain, but there are still a few small bare areas. These scoured areas have been depicted on Figures 2A-2B in Appendix B.

One area of easement encroachment was observed during year 5 (2018) monitoring. Due to a scoured hole within the crossing on the upstream portion of the unnamed tributary, making it impassable to livestock, the adjacent landowner had removed a section of fencing within the crossing in order to walk cattle to the next pasture. The cattle were walking through a small corner of the easement. This area is depicted on Figure 2A (Appendix B) and has been addressed by NCDMS. The landowner has made necessary repairs to the fence, and the easement encroachment has ceased.

Year 1 (2014) vegetation data indicated stem densities below the 400 stems per acre guaranteed survival during year 1 (2014). Per contract, Carolina Silvics conducted a supplemental planting at the Site in February/March 2015 with a total of 2,300 stems planted site-wide. Year 2 (2015) stem counts remained below 400 stems per acre, so an additional site-wide planting of 1,150 trees occurred in February 2016. During year 3 (2016) it was determined that the majority of the site was meeting the 400 stems per acre warranty with the exception of the wetter areas. To address this, an additional 1,000 sycamore (*Platanus occidentalis*) bare root seedlings were planted during February 2017 within these wetter areas across the Site. Additionally, Poast herbicide (sethoxydim) was applied to fescue via backpack sprayers to reduce competition. Appendix F contains information and mapping for the 2017 supplemental planting as well as the herbicide application log. The fescue treatment appears to have been successful in reducing competition with the newly planted stems; the newly planted stems appear vigorous.

BEAR CREEK (PHILLIPS)

Table 6 Vegetation Condition Assessment

Planted Acreage[1] **14.42**

Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Planted Acreage
1. Bare Areas	Very limited cover of planted woody and herbaceous material on floodplain	0.1 acres	Orange Polygon	13	0.18	1.2%
2. Low Stem Density Areas	None	0.1 acres	N/A	0	0.00	0.0%
			Total		0.18	1.2%
3. Areas of Poor Growth Rates or Vigor	None	0.25 acres	N/A	0	0.00	0.0%
			Cumulative Total	0	0.18	1.2%

Easement Acreage[2] **14.42**

Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Easement Acreage
4. Invasive Areas of Concern[4]	N/A	1000 SF	N/A	0	0.00	0.0%
5. Easement Encroachment Areas[3]	Livestock encroachment	none	Black Hatching	1	0.25	1.7%

1 = Enter the planted acreage within the easement. This number is calculated as the easement acreage minus any existing mature tree stands that were not subject to supplemental planting of the understory, the channel acreage, crossings or any other elements not directly planted as part of the project effort.

2 = The acreage within the easement boundaries.

3 = Encroachment may occur within or outside of planted areas and will therefore be calculated against the overall easement acreage. In the event a polygon is cataloged into items 1, 2 or 3 in the table and is the result of encroachment, the associated acreage should be tallied in the relevant item (i.e., item 1,2 or 3) as well as a parallel tally in item 5.

4 = Invasives may occur in or out of planted areas, but still within the easement and will therefore be calculated against the overall easement acreage. Invasives of concern/interest are listed below. The list of high concern spcies are those with the potential to directly outcompete native, young, woody stems in the short-term (e.g. monitoring period or shortly thereafter) or affect the community structure for existing, more established tree/shrub stands over timeframes that are slightly longer (e.g. 1-2 decades). The low/moderate concern group are those species that generally do not have this capacity over the timeframes discussed and therefore are not expected to be mapped with regularity, but can be mapped, if in the judgement of the observer their coverage, density or distribution is suppressing the viability, density, or growth of planted woody stems. Decisions as to whether remediation will be needed are based on the integration of risk factors by DMS such as species present, their coverage, distribution relative to native biomass, and the practicality of treatment. For example, even modest amounts of Kudzu or Japanese Knotweed early in the projects history will warrant control, but potentially large coverages of Microstegium in the herb layer will not likley trigger control because of the limited capacities to impact tree/shrub layers within the timeframes discussed and the potential impacts of treating extensive amounts of ground cover. Those species with the "watch list" designator in gray shade are of interest as well, but have yet to be observed across the state with any frequency. Those in *red italics* are of particular interest given their extreme risk/threat level for mapping as points where isolated specimens are found, particularly ealry in a projects monitoring history. However, areas of discreet, dense patches will of course be mapped as polygons. The symbology scheme below was one that was found to be helpful for symbolzing invasives polygons, particulalry for situations where the conditon for an area is somewhere between isolated specimens and dense, discreet patches. In any case, the point or polygon/area feature can be symbolized to describe things like high or low concern and species can be listed as a map inset, in legend items if the number of species are limited or in the narrative section of the executive summary.

* For the purposes of monitoring change in entrenchment ratio, the elevation of the floodprone width (2x max bankfull depth) from the asbuilt dataset is divided by the width at bankfull elevation from the current year's dataset.
** For the purposes of monitoring trends in the bank height ratio, the low bank height from the current year's dataset is divided by the bankfull depth from the asbuilt dataset.

* For the purposes of monitoring change in entrenchment ratio, the elevation of the floodprone width (2x max bankfull depth) from the asbuilt dataset is divided by the width at bankfull elevation from the current year's dataset.
** For the purposes of monitoring trends in the bank height ratio, the low bank height from the current year's dataset is divided by the bankfull depth from the asbuilt dataset.

CAROLINA SILVICS
Natural Resources Professionals

March 20, 2017

Mr. Jeff Schaffer
NC Division of Mitigation Services
217 West Jones Street, Suite 3000A
Raleigh, North Carolina 27603

Re: ***D14019S Bear Creek Phillips (26), Chatham County, NC***

Dear Mr. Schaffer:

This letter serves as our Site Maintenance Report for final activities at the above referenced project site.

On February 9 and 13, 2017, Carolina Silvics installed 1,000 sycamore (*Platanus occidentalis*) bare root seedlings in areas throughout the site that were not meeting success criteria. The attached exhibit details the approximate areas and stems per area that were planted. We also applied Poast® herbicide (sethoxydim) from backpack sprayers to fescue growing in these areas to attempt to reduce competition. A pesticide application log for this application is attached.

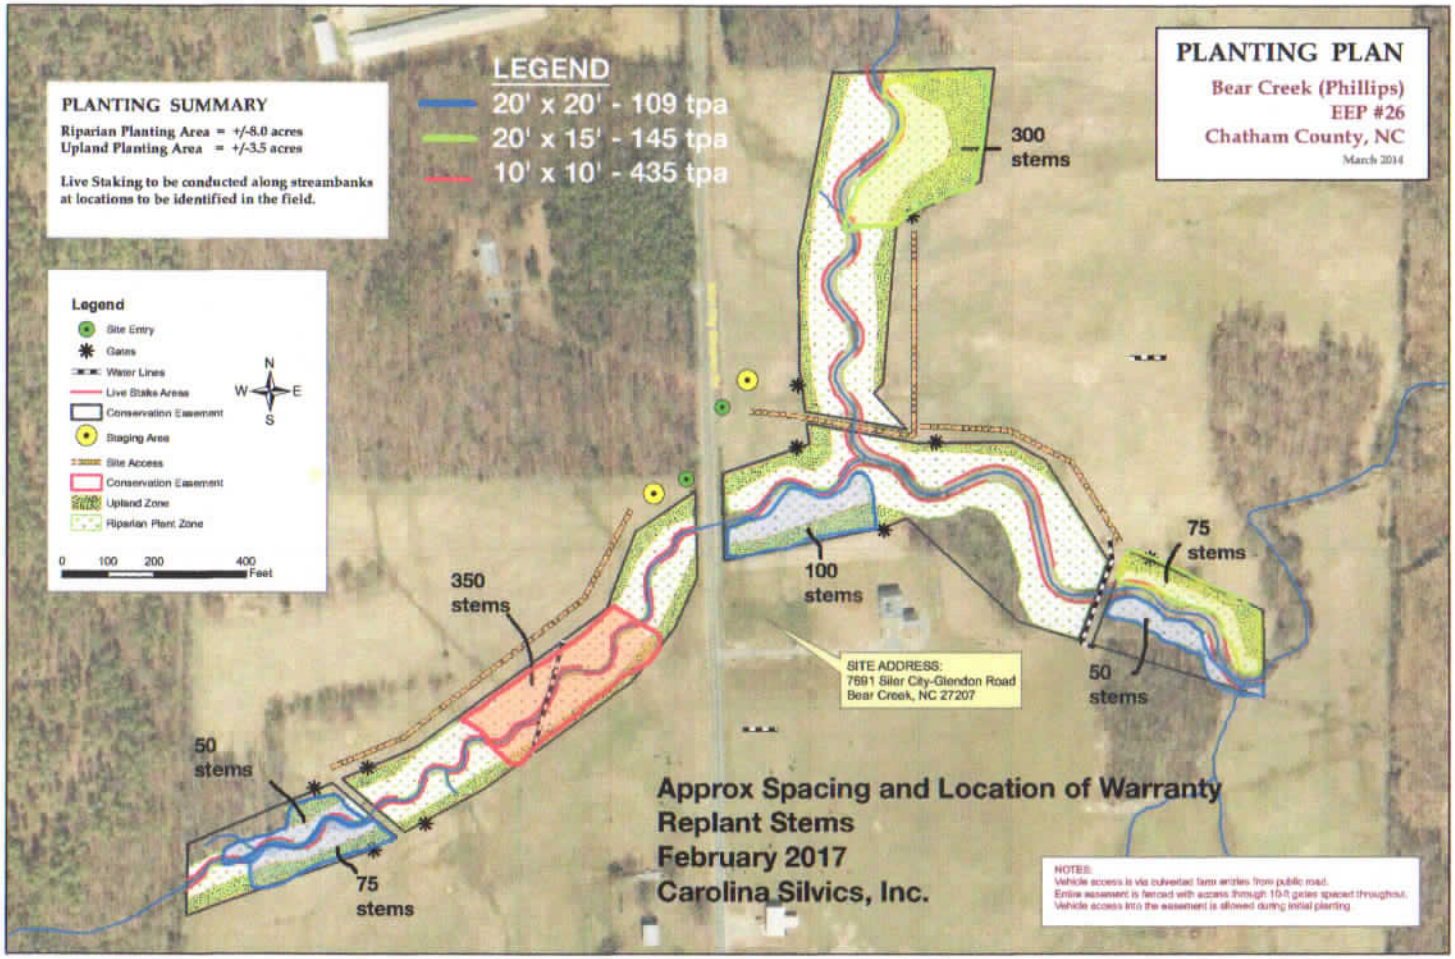
If you have any questions regarding this report, please feel free to contact me at (252) 482-8491 or mary-margaret@carolinasilvics.com. Otherwise, we will consider this project closed out and expect acceptance and subsequent payment of our final invoice for this project.

Respectfully,

CAROLINA SILVICS, INC.

Mary-Margaret S. McKinney

Mary-Margaret McKinney, RF
President



PLANTING PLAN
Bear Creek (Phillips)
EEP #26
Chatham County, NC
March 2014
PLANTING SUMMARY
Riparian Planting Area = +/-8.0 acres
Upland Planting Area = +/-3.5 acres
Live Staking to be conducted along streambanks at locations to be identified in the field.

Project Site	UT to Bear Creek (Phillips) #26		
Date	02-13-2017		
Start Time	9:00	End Time	10:50
Only PAL for Site for This Day?	Yes	If NO, this is PAL # of ##	
Sky Cover	Partly Cloudy	Temp (F)	58
Wind Direction	SE	Wind Speed	1-5 mph
Applicators	Sebastian Kimlinger (NC 026-34613)		
Application Method	Foliar Spray (Backpack)		
Herbicide	Poast® (sethoxydim)		
Herbicide Rate (%)	1.5	Total Concentrate	6 oz
Surfactant or Adjuvant (1)	Other (see comments)		
Surfactant/Adjudivant 1 Rate (%)	.5		
Other			
Other Rate/Amt			
Diluent	Water		
Total Solution	3 gallons		
Species Controlled	Fescue		
Area Description	Fescue along planting area		
Additional Comments	CWC Sufactant 90
