I. Executive Summary/Project Abstract

Beaver Creek is 3.6 miles southeast of Dobson, NC. The site is accessed from the end of Johnny Bowman Road (SR 2212). At the end of the Johnny Bowman Road and to the left, is a farm driveway that is currently owned by Mr. Mike Jones. About half way down the driveway, a farm road branches off to the right. This farm road leads to the Beaver Creek and parallels the first two thirds of the restoration reach.

The Beaver Creek project consists of 4360 linear feet of stream restoration. The restoration is the last 4360 feet of Beaver Creek prior to the confluence with the Fisher River. Beaver Creek (NCDWQ Stream Index Number – 12-63-12) is located on agricultural land and within one of the most significant agricultural districts in Surry County. The land use in the watershed is a mixture of pasture, row crops and forests. The Beaver Creek watershed covers an area of 5.9 square miles. The project is fully contained within the property of five landowners.

Following are the goals and objectives for the Beaver Creek project:

1. Restore 4360 linear feet of Beaver Creek (as measured along the thalweg).
2. Provide a stable stream channel that neither aggrades nor degrades while maintaining its dimension, pattern, and profile with the capacity to transport its watershed's water and sediment load.
3. Improve water quality and reduce further property loss by stabilizing eroding stream banks.
4. Reconnect the stream to its floodplain or establish a new floodplain at a lower elevation.
5. Improve aquatic habitat with the use of natural material stabilization structures such as root wads, rock vanes, woody debris and establish a riparian buffer.
6. Provide aesthetic value, wildlife habitat and bank stability through the creation or enhancement of a riparian zone.

The Priority I restoration involved converting the impaired channel into a sinuous channel that meanders for a total of 4360 ft as measured along the thalweg. Rock and log cross-vanes and rootwads were incorporated for aquatic habitat enhancement and bed and bank stability. A 50-foot riparian buffer on either side of the stream was planted with native vegetation.

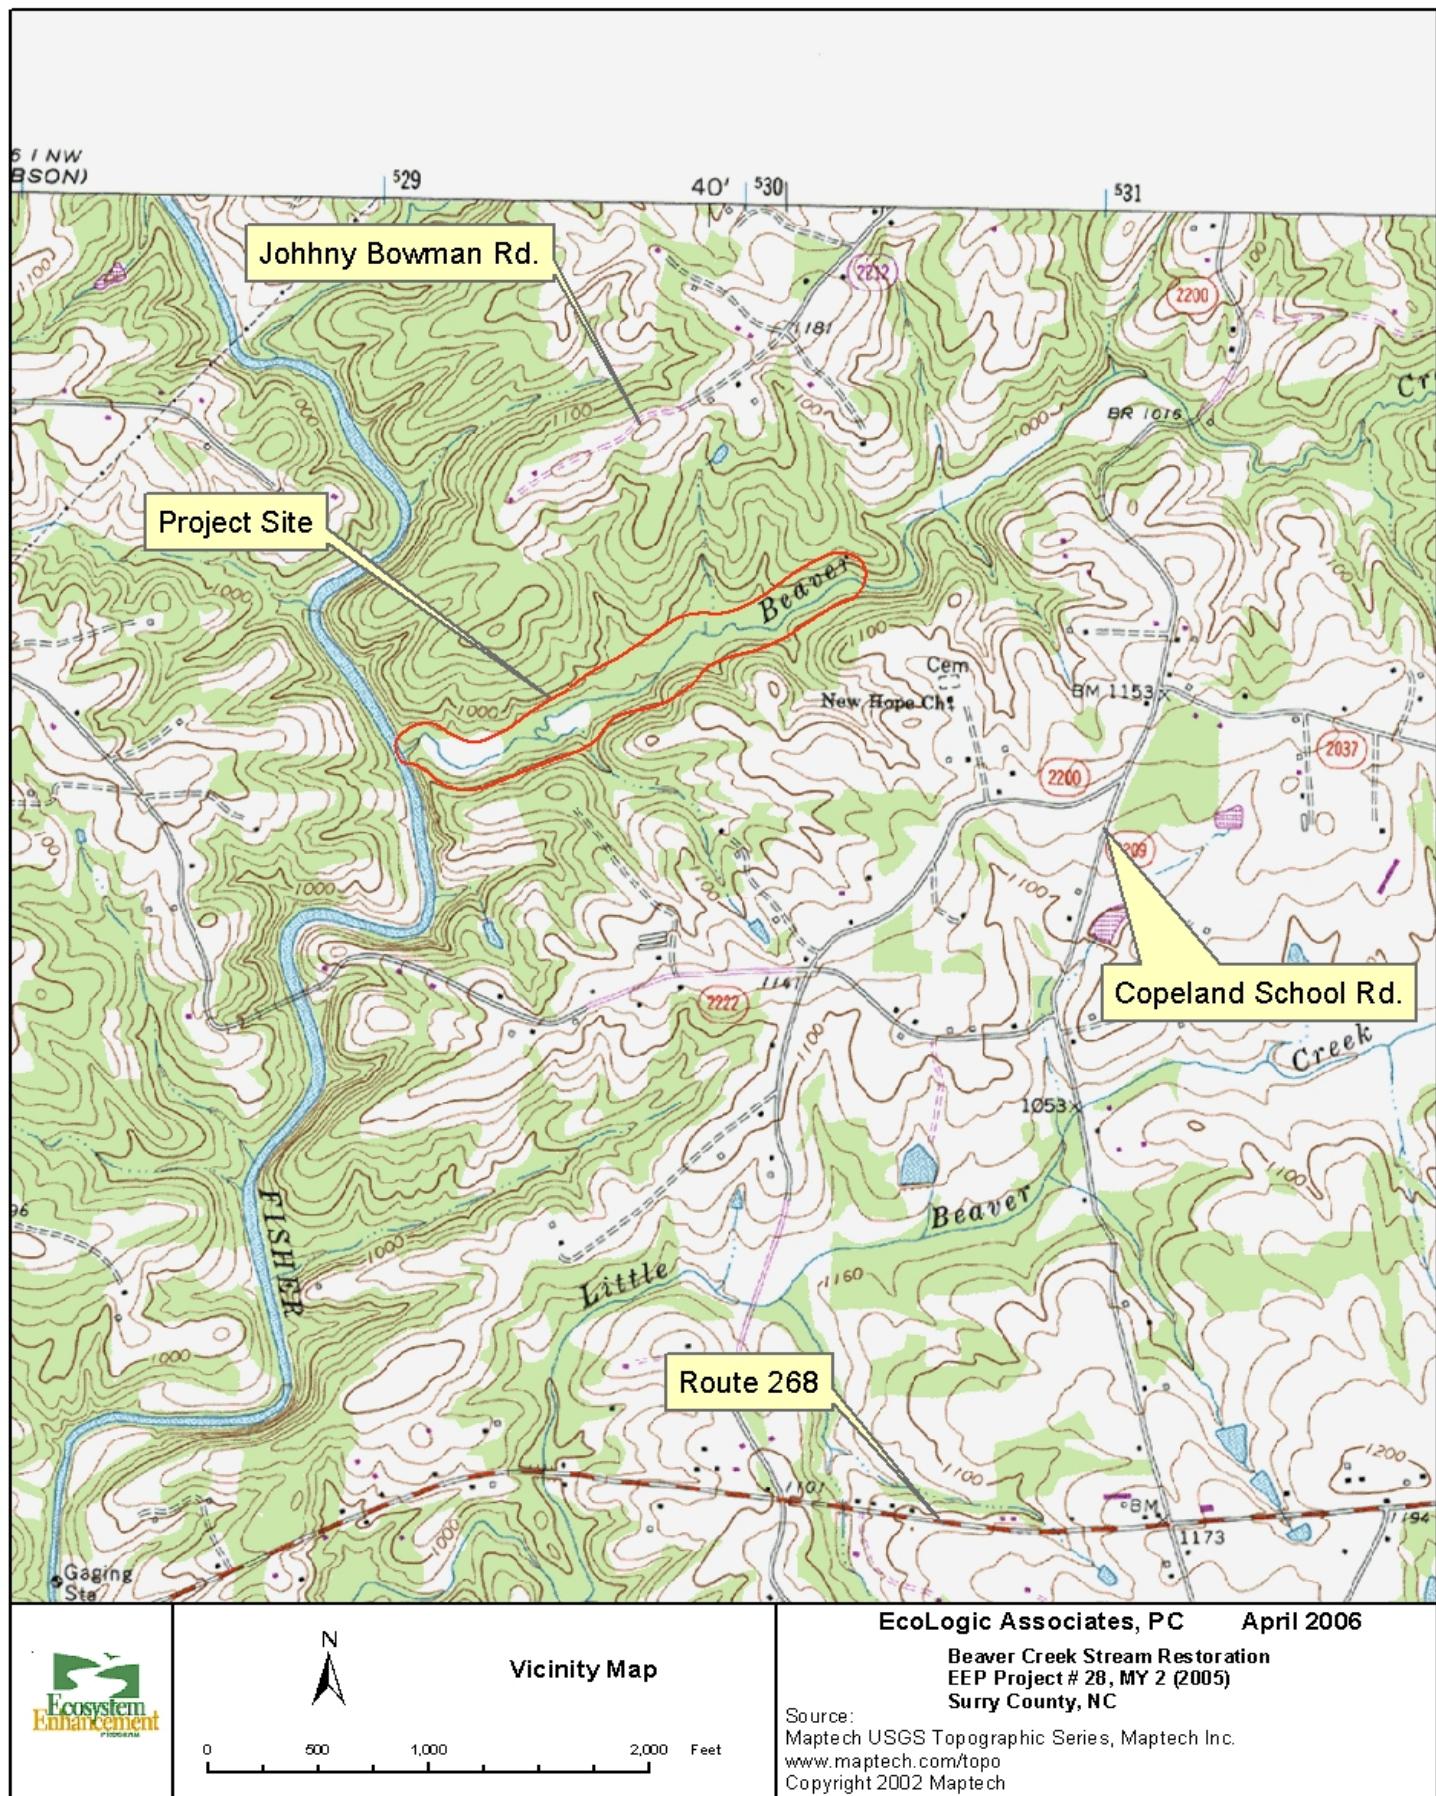

Currently, the Beaver Creek project substantially fails to meet the goals and objectives. Design of the Beaver Creek restoration was completed during 2001 and construction was completed in 2002. Serious damage and deterioration of the restoration started in 2003 and continues to the present day. Many of the same problem areas that are documented in this 2005 report were also noted in the past monitoring reports conducted by NCSU. The stream continues to deteriorate and will not recover and stabilize without further design and construction.

II. Project Background

1. Location and Setting

Beaver Creek is 3.6 miles southeast of Dobson, NC. The site is accessed from the end of Johnny Bowman Road (SR 2212). At the end of the Johnny Bowman Road and to the left, is a farm driveway that is currently owned by Mike Jones. About half way down the driveway, a farm road branches off to the right. This farm road leads to the Beaver Creek and parallels the first two thirds of the restoration reach.

The Beaver Creek project consists of 4670 linear feet of stream restoration. The restoration is the last 4360 feet of Beaver Creek prior to the confluence with the Fisher River. Beaver Creek (NCDWQ Stream Index Number – 12-63-12) is located on agricultural land and within one of the most significant agricultural districts in Surry County. The land use in the watershed is a mixture of pasture, row crops and forests. The Beaver Creek watershed covers an area of 5.9 square miles. The project is fully contained within the property of five landowners.

2. Structure and Objectives

The Beaver Creek restoration site is located entirely within undeveloped land consisting of agricultural land predominantly being used for hay production, woodland, and sparse crop production. There are no utilities within the project limits. The combination of these characteristics makes Beaver Creek an excellent restoration site.

Following are the goals and objectives for the Beaver Creek project:

1. Restore 4360 linear feet of Beaver Creek (as measured along the thalweg).
2. Provide a stable stream channel that neither aggrades nor degrades while maintaining its dimension, pattern, and profile with the capacity to transport its watershed's water and sediment load.
3. Improve water quality and reduce further property loss by stabilizing eroding stream banks.
4. Reconnect the stream to its floodplain or establish a new floodplain at a lower elevation.
5. Improve aquatic habitat with the use of natural material stabilization structures such as root wads, rock vanes, woody debris and establish a riparian buffer.
6. Provide aesthetic value, wildlife habitat and bank stability through the creation or enhancement of a riparian zone.

The Priority I restoration involved converting the impaired channel into a sinuous channel that meanders for a total of 4360 ft as measured along the thalweg. Rock and log cross-vanes and rootwads were incorporated for aquatic habitat enhancement and bed and bank stability. A 50-foot riparian buffer on either side of the stream was planted with native vegetation.

3. Project History and Background

The Surry County Soil and Water Conservation District (SCSWCD) staff identified Beaver Creek as a potential restoration site after landowners complained about active erosion and flooding adjacent to the stream. The stream was actively eroding along a tight meander located on the property owned by Mr. Mike Jones. The extensive erosion created a meander with a sharp radius where during storm events; water was overtopping the bank and flooding the adjacent landowner, Mr. Wayne Draughn.

Besides the above stated problem area, Beaver Creek had other areas of significant active bank erosion throughout the proposed project limits. There is evidence of historic straightening that resulted in stream degradation. Thinning and removal of riparian vegetation also contributed to the stream degradation. The degradation included a deeply incised channel that accelerated the erosion process and forced the channel to contain larger than bankfull storm events. One of the three tributaries, within the project limits, had also been straightened. Currently, the Beaver Creek project substantially fails to meet the goals and objectives. Design of the Beaver Creek restoration was completed during 2001 and construction was completed in 2002. Serious damage and deterioration of the restoration started in 2003 and continues to the present day. Many of the same problem areas that are documented in this 2005 report were also noted in the past monitoring reports conducted by NCSU. The stream continues to deteriorate and will not recover and stabilize without further design and construction.

Feature Issue	Station	Suspected Cause	Photo	Severity
Density	42+00	Bank erosion	PA1	Red
Density	22+50	Bank erosion	PA18	Red

Please see Appendix A.2

3. Vegetation Problem Areas Plan View

Vegetation within the riparian buffer of Beaver Creek varies in success. Much of the buffer is covered with dense, lush, native herbaceous vegetation. Live stakes are marginally healthy in certain areas, although many were washed out due to high water and bank sloughing. Planted trees and shrubs are doing poorly throughout the entire buffer. Few trees were counted in vegetation monitoring plots. Although some stakes were thriving, most stakes and trees were missing. Further, the live shrub and tree stems were heavily browsed by deer. Overall, planted trees were not successful.

Deposition, over wash, and erosion has occurred since construction, and large areas that were originally impacted by construction have little existing cover. However, the banks that were less impacted by construction have a good cover of mature trees that provide bank stability and provide a potential seed source for natural tree regeneration.

Project: Beaver Creek Stream Restoration
Prepared For: Surry County, NC
Prepared By: NC Ecosystem Enhancement Program

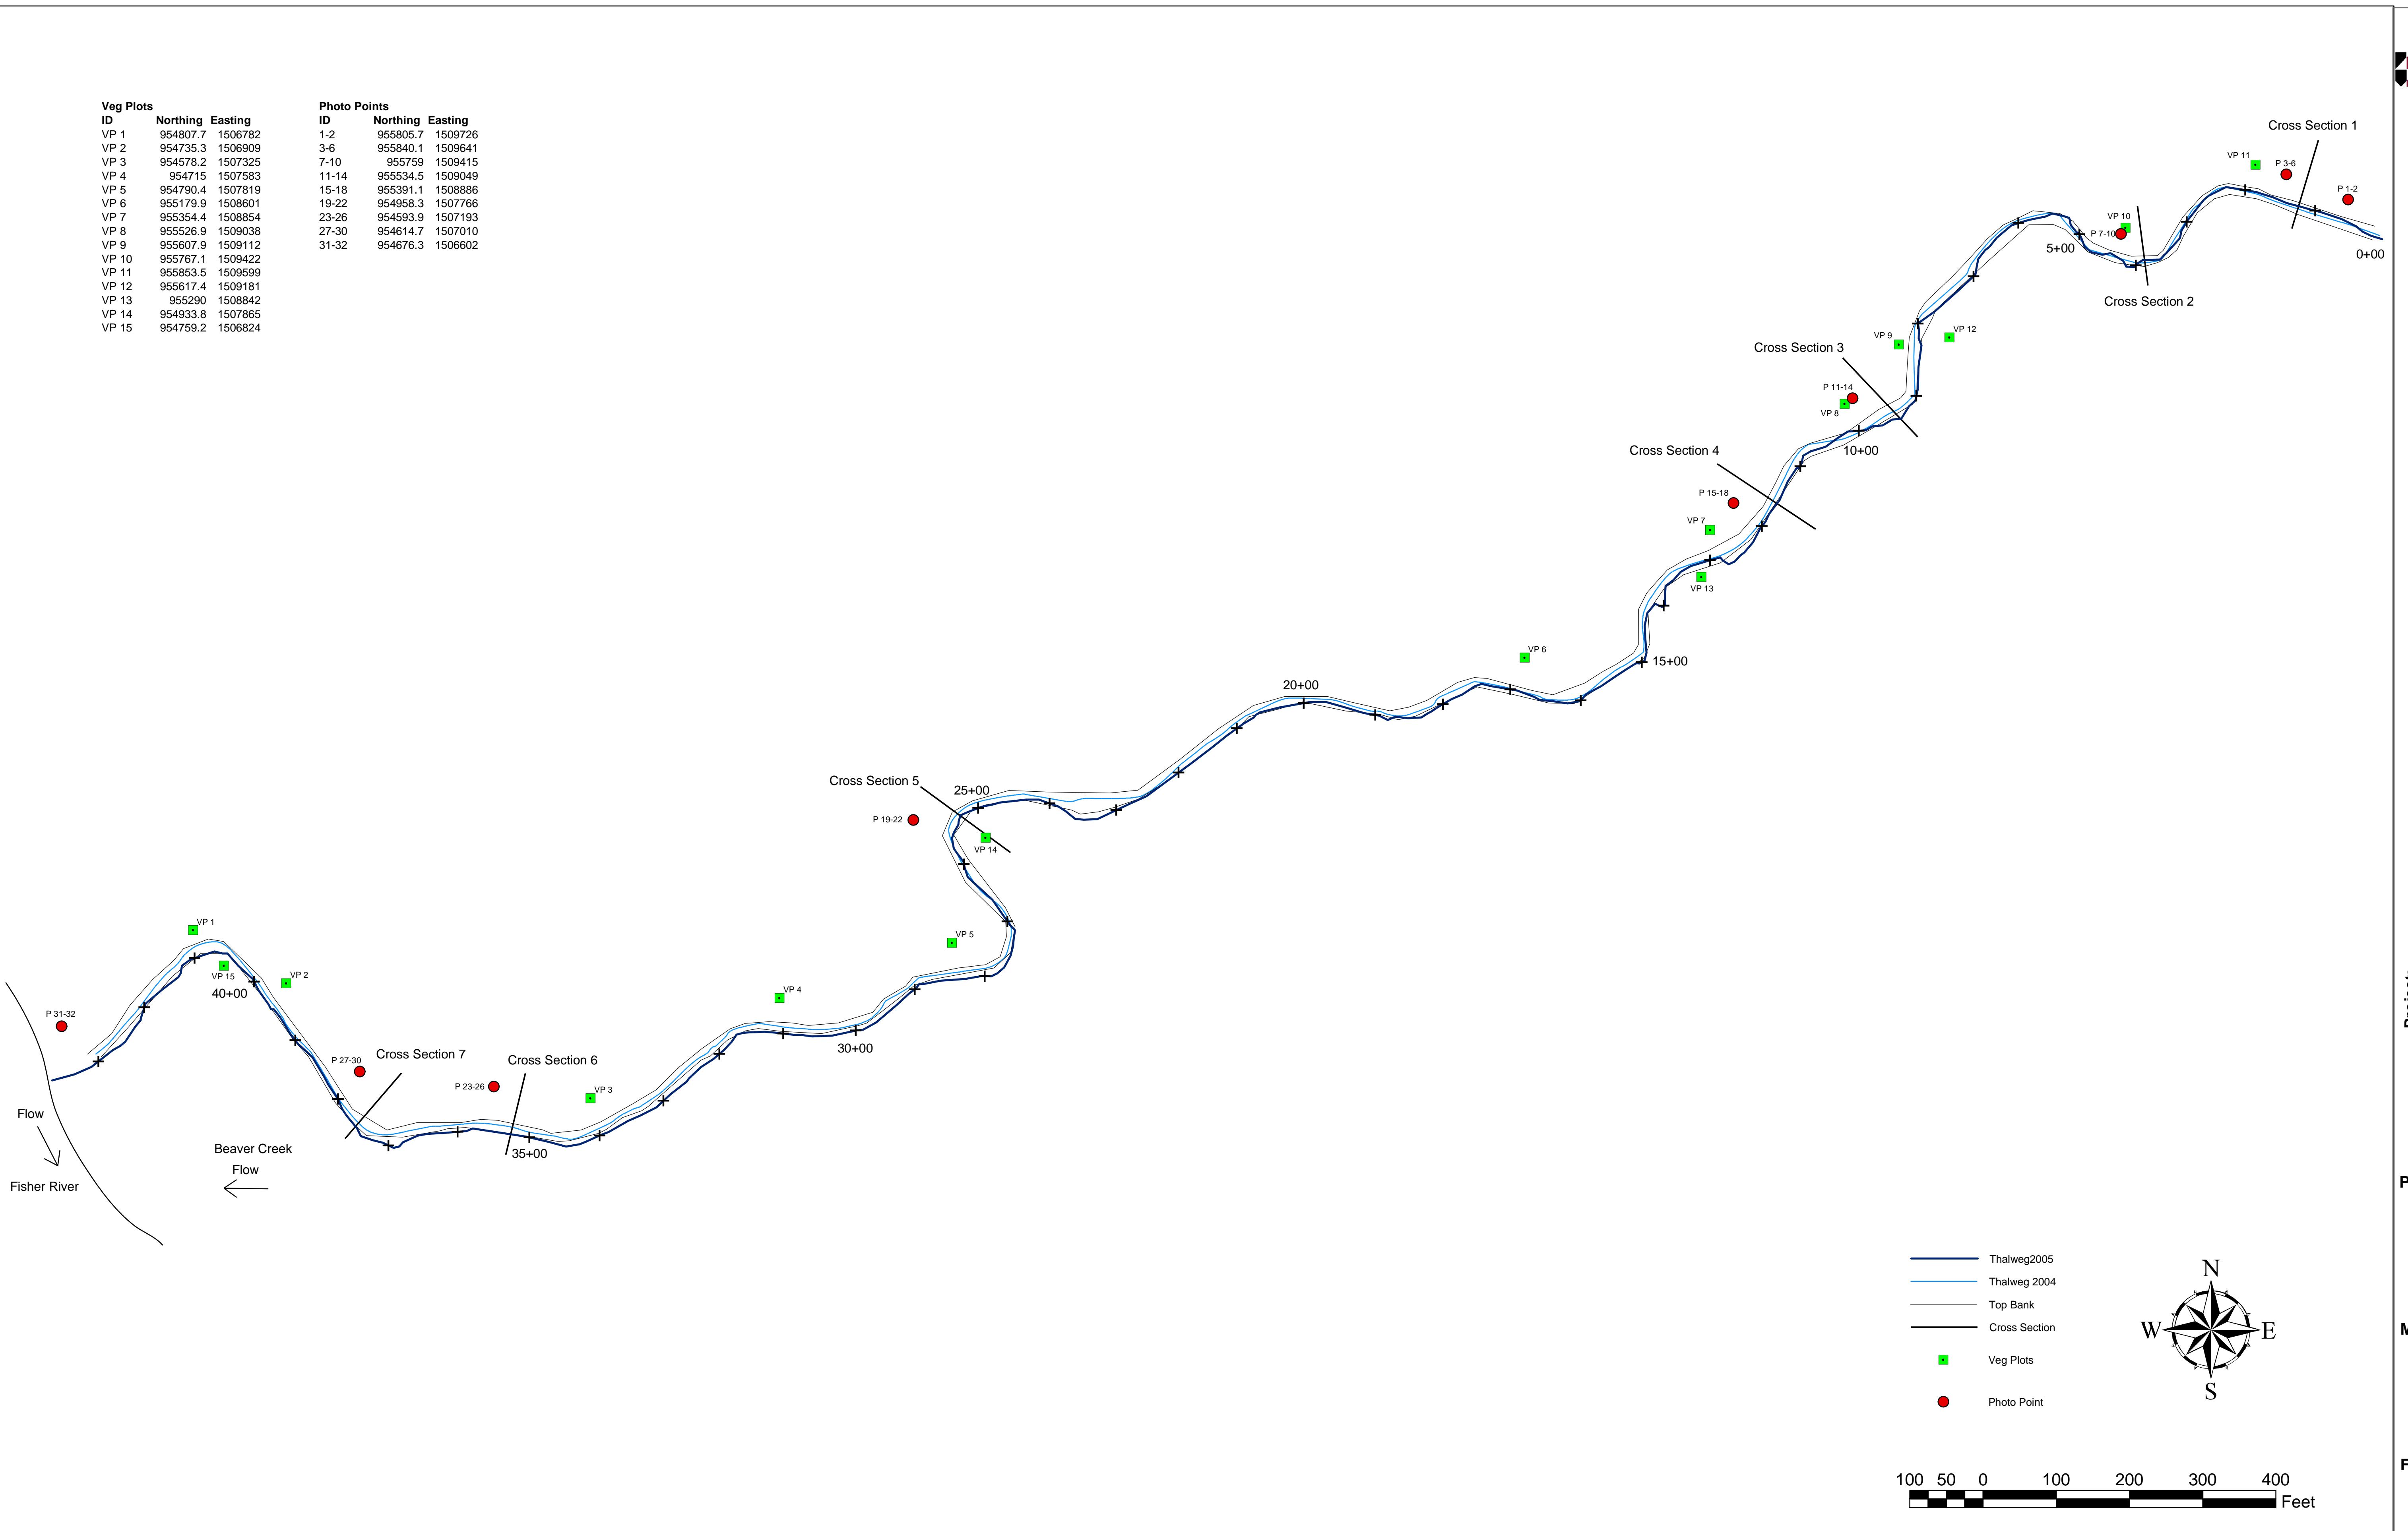

Project Number: 28

Map Title: Monitoring Plan View

Monitoring Year: 2 (2005)

Date: 2/27/06

Figure Number: 3

Recommendations include replanting larger containerized trees to obtain mitigation requirements and staking in areas where erosion is problematic. Measures should be taken to prevent deer browse of planted vegetation. Although invasive vegetation is not a major issue on this project site, exotic invasive species present include *Microstegium vimineum* (Japanese grass), *Lonicera japonica* (Japanese honeysuckle), *Pueraria montana* var. *lobata* (Kudzu) and *Paulownia tomentosa* (Princess tree). Control measures may be necessary if these species become dense.

Please see Appendix A.1.

4. Stem Counts

Please see following page for Table VIII

Please see Appendix A.2 for raw data tables

5. Vegetation Plot Photos

Please see Appendix A.4

B. Stream Assessment

1. Problem Areas Plan View

The Beaver Creek restoration has deteriorated since construction. There is evidence in the field of insufficient length and caliper rootwads that were improperly installed. The constructed structures contain poorly fitted small and odd size rocks. For these reasons, many, if not most, of the structures have failed to control the thalweg at low flows, have failed at high flows and do not protect the adjacent stream banks. The result is a cascade failure of structures, channel morphology and banks that results in a channel that is failing to meet the restoration goals. EcoLogic recommends that a re-design and reconstruction is required to stabilize Beaver Creek and to meet the restoration goals and objectives.

Please see Appendix B.1

4. Fixed Photo Station Points

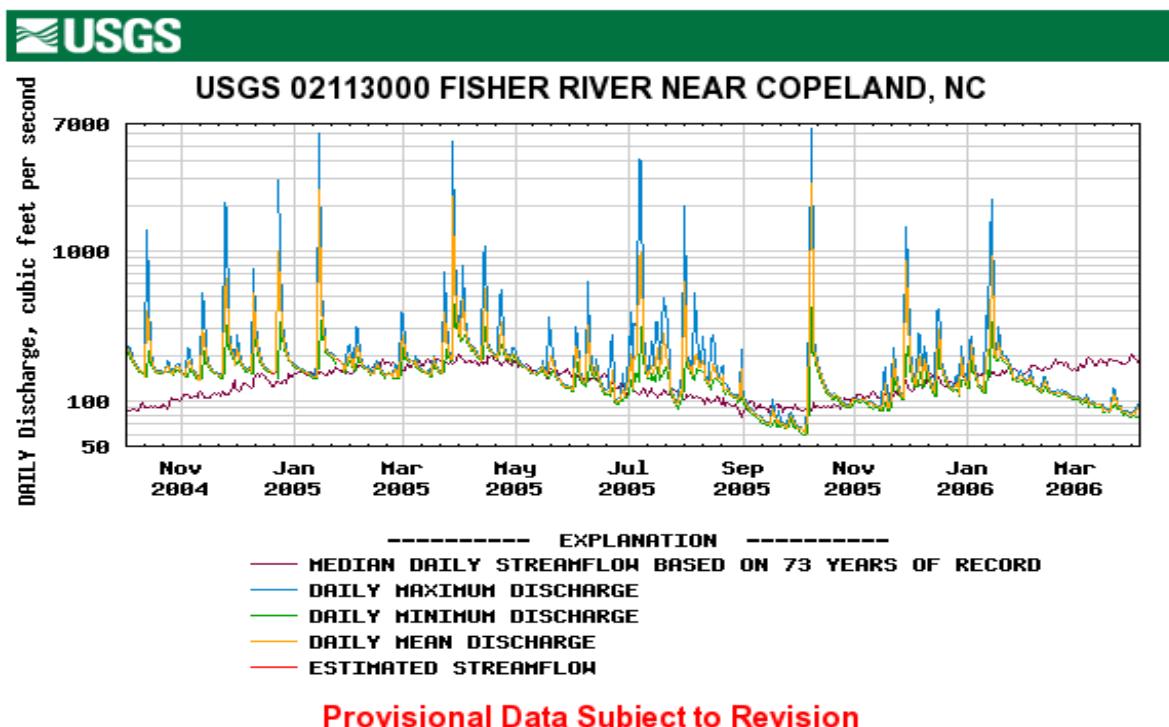

Please see Appendix B.3

5. Stability Assessment

No Table X exists because it was not applicable to this project.

6. Quantitative Morphology

No crest gages are installed at this site to document bankfull events. Therefore, potential occurrence was extrapolated based on USGS stream gage discharge data for the Fisher River near Copeland, NC. The gage is located within 1 mile of the project site in the same watershed and has a drainage area of 128 square miles. An estimate of the number of bankfull events in 2005 was made by comparing the stream discharges from the USGS data in cubic feet per second (cfs) against the bankfull discharge estimated from the drainage area on the Rural Piedmont NC Regional Curve. According to the regional curve, a bankfull event occurs on a stream with a 128-mi² drainage area when the discharge is about 2,930 cfs. Based on this primary surrogate USGS data, an estimated four (4) bankfull events occurred in 2005.

Please see pages 12-13 for Table XI and XII

IV. Methodology Section

The methods used to generate the data in this monitoring report are standard fluvial geomorphology techniques as described in *Applied River Morphology*, 1996, D.L. Rosgen and related publications from US Forest Service and the interagency Stream Mitigation Guidelines, 2003, USACOE, USEPA, NCWRC, NCDENR-DWQ.

EcoLogic's field morphology survey was conducted using a Nikon total station and the data was analyzed and displayed using RiverMorph version 3.1 software. The pebble counts were conducted using Pocket RiverMorph software and a PDA. The vegetation problem areas and structural problem areas were noted in the field on the PDA.

Photographs were taken at medium-high resolution using a Nikon Coolpix 4600 digital camera.

GPS location information was collected using a Trimble Geo XT handheld mapping grade GPS unit. GPS locations were collected on all problem areas, photo points and at least one corner of each vegetation-monitoring plot.

Vegetation monitoring plots were marked in the field by placing a steel conduit with blue flagged at each corner. In addition, the up-stream, outside corner was marked with a three-foot length of white plastic pipe tied with orange flagging. Individual plants in the monitoring plots were tied with white flagging.

Appendix B.4

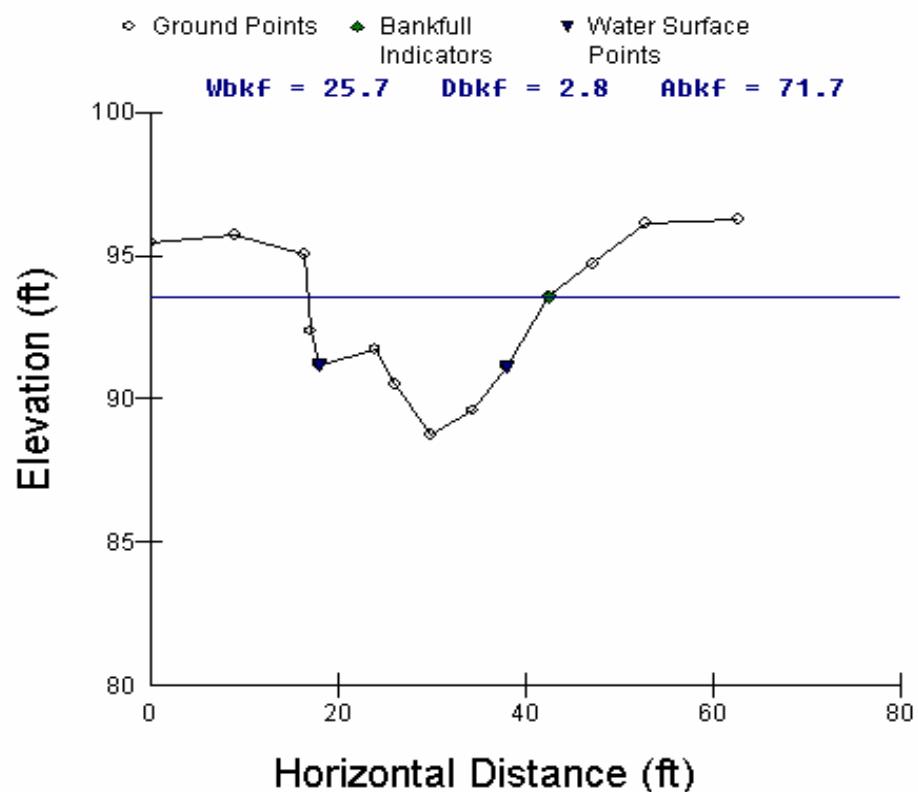

Table B1. Qualitative Visual Stability Assessment						
Project Number: 00028						
Segment/Reach: Beaver Creek						
Feature Category	Metric (per as-built and reference baselines)	(# Stable) Number performing as intended	Total number per as-built	Total number / feet in unstable state	% Perform in stable condition	Feature Perform. Mean or Total
A. Riffles	1. Present?	28	28	0	100	
	2. Armor stable (e.g. no displacement)?	28	28	0	100	
	3. Facet grade appears stable?	28	28	0	100	
	4. Stable interval grade?	14	28	14/1300	50	
	5. Feature spacing appropriate?	28	28	0	100	
	6. Minimal evidence of embedding/fining?	28	28	0	100	
	7. Depth appears appropriate for current discharge?	28	28	0	100	
	8. Length appropriate?	14	28	14/1300	50	
						87.5
B. Pools	1. Present? (e.g not subject to severe aggradation?)	35	35	0	100	
	2. Sufficiently deep (Max Pool D:Mean Bkf >1.6?)	35	35	0	100	
	3. Thalweg located outer bend?	11	35	750	31	
	4. Spacing appropriate?	35	35	0	100	
	5. Non-aggrading (not filling)?	35	35	0	90	
	6. Length appropriate?	35	35	0	100	
C. Thalweg	1. Upstream of meander bend (run/inflection) centering?	35	35	0	100	
	2. Downstream of meander (glide/inflection) centering?	35	35	0	100	
D. Meanders	1. Outer bend in state of limited/controlled erosion?	35	35	0	100	20
	2. Of those eroding, # w/concomitant point bar formation?	0	NA	0	NA	NA
	3. Apparent Rc within spec?	NA	NA	NA	NA	NA
	4. Sufficient floodplain access and relief?	All	NA	None	100	NA
E. Bed - General	1. General channel bed aggradation areas (bar formation)	All	NA	None	100	
	2. Channel bed degradation – areas of increasing down-cutting or head cutting?	All	NA	None	100	
F. Channel Capac./Dimen.	1. Channel width: depth appears out of design/type spec?	All	NA	None	100	
G. Banks	1. Apparent scour points from channel processes	3	NA	3/300	NA	3
	2. Apparent cut points from overland flow	All	NA	None	100	
	3. Apparent cut or scour from flood water re-entry to channel (e.g. inadequate floodplain access?)	All	NA	None	100	NA
	4. Tension cracks	All	NA	None	100	NA
	5. Unstable cantilever blocks (e.g. height/undercut/soil type versus vegetation penetration and extent)	All	NA	None	100	NA
	6. Bank gradient in excess of 40%?	All	NA	None	100	NA
	7. Collapse/slumping	18	NA	18/770	NA	18
	8. Ratio of bank height: bankfull height elevated	All	NA	None	100	NA
H. Vanes	1. Free of back or arm scour?	16	30			
	2. Height appropriate?	All	NA	None	100	NA
	3. Angle and geometry appear appropriate?	All	NA	None	100	NA
	4. Free of piping or other structural failures?	All	NA	None	100	NA
I. Wads/ Boulders	1. Free of scour?	20	52	32	38	38
	2. Footing stable?	20	52	32	38	38
	NA = Historical project documents necessary to provide this data were unavailable at the time of this report submission
