## MONITORING SUMMARY

The Unnamed Tributary (UT) to Billy's Creek Stream Restoration Project is located northeast of Franklinton in Franklin County, North Carolina. The project reach is located in a sparsely developed agricultural watershed, mostly used for cattle pasture. Pre-construction conditions of the UT to Billy's Creek included a 1,878 linear foot section of degraded, perennial channel and several ditch-like tributaries. The upstream portions of the project reach retained an active floodplain area, whereas the downstream portions were severely incised (4 to 6 feet). The restoration of the UT to Billy's Creek was conducted as a Priority I restoration by returning the channel to an elevation such that the historic floodplain is utilized for over-bank flows. The proposed stream classification for the project reach was a meandering E5 channel, with a total length of 2,101 linear feet. The goals and objectives for the Unnamed Tributary to Billy's Creek Stream Restoration Project are to:

- Restore the project reach to a more natural dimension, pattern and profile so that the stream will be able to efficiently transport water and sediment loads provided by the watershed;
- Reconnect the project reach's channel to its historic floodplain where feasible;
- Eliminate the excessive sediment contribution to the system by the mass wasting and erosion of the stream banks along the reach; and
- Repair and restore the riparian corridor along the project reach in order to improve habitat and protect the stream from further erosion.

Good planted stem densities were found for all five vegetation plots for UT to Billy's Creek. Stem densities were above the final Monitoring Year 5 goal of 260 stems per acre for all plots. The overall stem density (excluding live stakes) across all vegetation plots was over 420 living planted stems per acre. Several regions of invasive species were identified throughout the riparian buffer. The site was treated in 2010 for invasive species and will also be treated in 2011.

The majority of the UT Billy's Creek restoration reach remained stable through Monitoring Year 5 with the exception of a 384 foot section of sand deposition at the upstream end of the reach (Station 10+00 to 13+84). Excess sand deposition has completely filled the channel and blanketed out over the floodplain making it very difficult to locate the main channel in the upstream-most 150 feet due to braiding. This deposition has changed the channel dimension and profile significantly over the monitoring period. Cross Section 1 (Station 11+55) clearly shows a steady streambed elevation rise through Monitoring Year 5 that is likely correlated with this deposition. Furthermore, the Monitoring Year 5 bankfull cross sectional area of Cross Section 1 was the lowest documented compared to the four previous monitoring years. Approximately 15% of the channel has aggraded (primarily the upper section) or has significant bed deposition

Bank instability is a minor issue with bank erosion impacting less than 1% of the total bank length. All structures appeared to be in good physical condition. The only structure associated problems noted for Monitoring Year 5 are several structures and their associated pools that have been buried under excess sand deposition.

Summary information/data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the mitigation and restoration plan documents available on EEPs website. All raw data supporting the tables and figures in the appendices is available from EEP upon request.

## METHODOLOGY

### Vegetation Methodology

The following methodology was used for the stem count. The configuration of the vegetation plots was marked out with tape to measure 10 meters by 10 meters (or equivalent to 100 square meters) depending on buffer width. The planted material in the plot was marked with flagging. Plot inventories were conducted per the 2006 CVS-EEP Protocol for Recording Vegetation (EEP 2006).

### Stream Methodology

The project monitoring for the stream channel included a longitudinal survey, cross-sectional surveys, problem area identification, and photo documentation. The specific methodology for each portion of the stream monitoring is described in detail below.

#### *Longitudinal Profile and Plan View*

A longitudinal profile was surveyed with a Nikon DTM-520 Total Station, prism, and a TDS Recon Pocket PC. The heads of features (i.e., riffles, runs, pools, and glides) were surveyed, as well as the point of maximum depth of each pool, boundaries of problem areas, and any other significant slope-breaks or points of interest. At the head of each feature and at the maximum pool depth, thalweg, water surface, edge of water, left and right bankfull, and left and right top of bank (if different than bankfull) were surveyed. All profile measurements were extracted from this survey, including channel and valley length and length of each feature, water surface slope for each reach and feature, bankfull slope for the reach, and pool spacing. This survey also was used to draw plan view figures with Microstation v8 (Bentley Systems, Inc., Exton, PA). All pattern measurements (i.e. meander length, radius of curvature, belt width, meander width ratio, and sinuosity) were extracted from the plan view. Stationing was calculated along the thalweg.

#### *Permanent Cross Sections*

Four permanent cross sections (two riffles and two pools) were surveyed. The beginning and end of each permanent cross section were originally marked with a long PVC tube. Cross sections were installed perpendicular to the stream flow. Each cross section survey noted all changes in slopes, tops of both banks (if different from bankfull), left and right bankfull, edges of water, thalweg and water surface. The cross sections were then plotted, and Monitoring Year 5 data was overlain on data from all previous monitoring years for comparison. All dimension measurements (i.e. bankfull width, floodprone width, bankfull mean depth, cross sectional area, width-to-depth ratio, entrenchment ratio, bank height ratio, wetted perimeter, and hydraulic radius) were extracted from these plots and compared to the Monitoring Year 1 data.

#### *Pebble Counts*

Based on the fact that UT Billy's is a sand bed stream, it was determined that pebble counts were unnecessary as they would fail to detect changes in fine sediment amounts in the channel bed. Therefore, pebble counts were not performed for Monitoring Year 5.

#### Photo Documentation

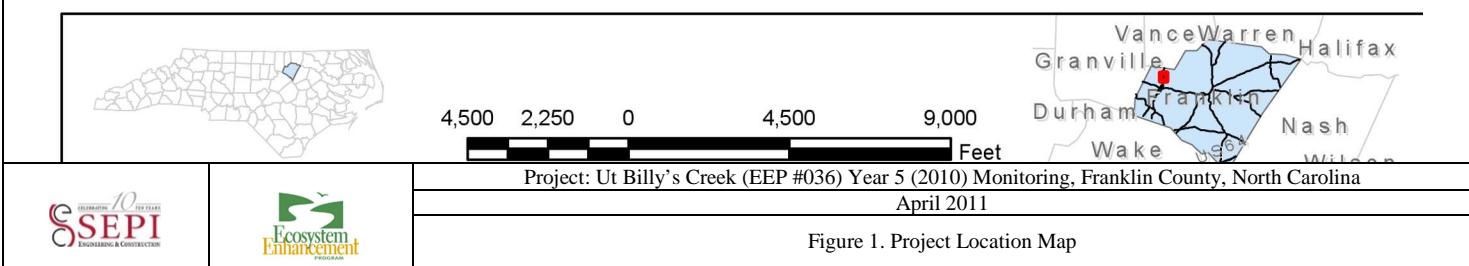

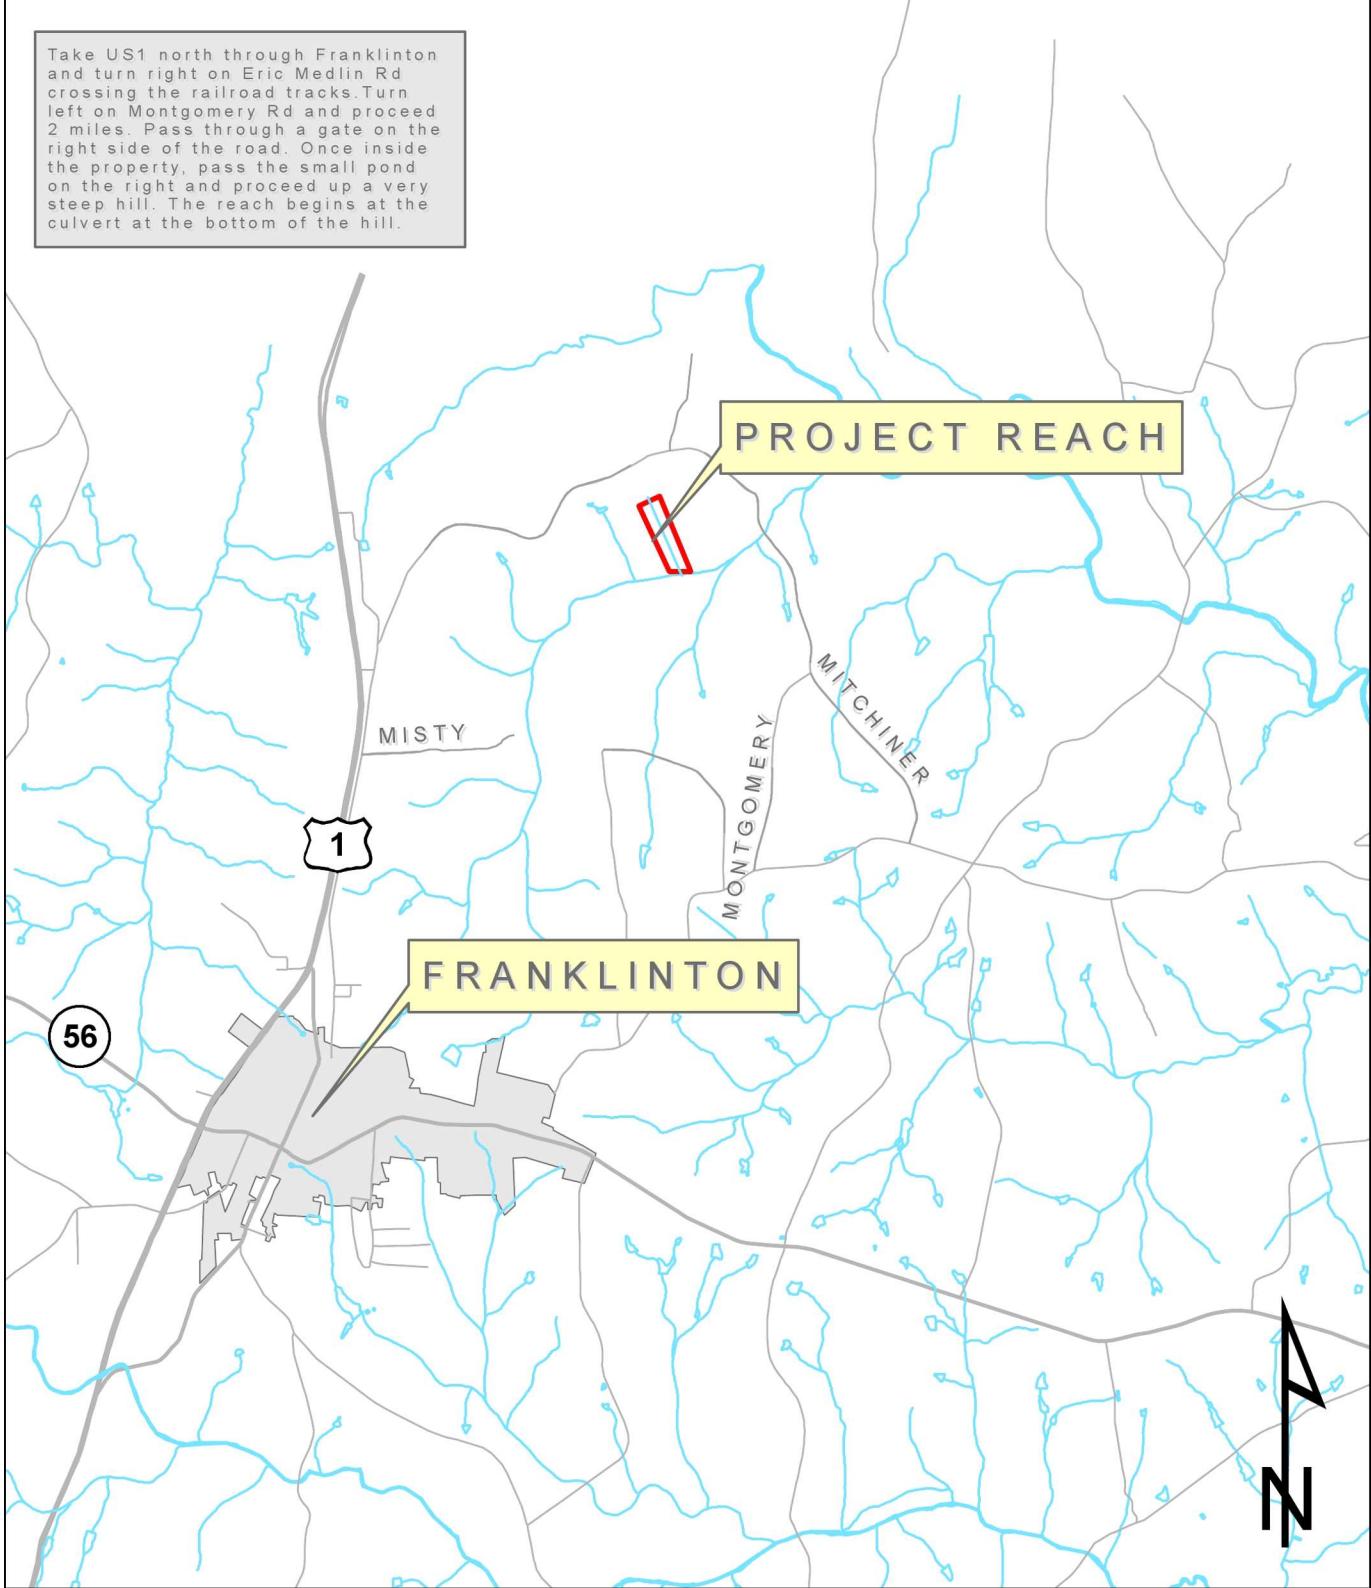

Permanent photo points were established during Monitoring Year 1. A set of three photographs (facing upstream, facing downstream, and facing the channel) were taken at each photo point with a digital camera. Two photographs were taken at each cross-section (facing upstream and downstream). A representative photograph of each vegetation plot was taken at the designated corner of the vegetation

plot and in the same direction as the Monitoring Year 1 photograph. An arrow was placed on the designated corner of each vegetation plot on the plan view sheets to document the corner and direction of each photograph. Photos were also taken of all significant stream and vegetation problem areas.

**DESCRIPTION OF WORKSHEETS IN THIS DOCUMENT-----**

**Metadata** Description of database file, the report worksheets, and a summary of project(s) and project data.

**Proj, planted** Each project is listed with its PLANTED stems per acre, for each year. This excludes live stakes.

**Proj, total stems** Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems.

**Plots** List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.).

**Vigor** Frequency distribution of vigor classes for stems for all plots.

**Vigor by Spp** Frequency distribution of vigor classes listed by species.

**Damage** List of most frequent damage classes with number of occurrences and percent of total stems impacted by each.

**Damage by Spp** Damage values tallied by type for each species.

**Damage by Plot** Damage values tallied by type for each plot.

**Planted Stems by Plot and Spp** A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded.

**All Stems by Plot and spp** A matrix of the count of total living stems of each species (planted and natural volunteers combined) for each plot; dead and missing stems are excluded.

Pebble counts were not performed for UT Billy's Creek during Monitoring Year 5 because it is a sandbed stream and the counts would not successfully detect changes in the amounts of fine sediments in the channel bed.

## Appendix E

### Hydrologic Data

Table 12. Verification of Bankfull Events			
Date of Data Collection	Date of Occurrence	Method	Photo # (if available)
6/28/2006	6/14/2006	Per NOAA staff member, Jonathan Blaes, Tropical Storm Alberto produced a 50-year storm event in the Franklinton/Louisburg area. The storm produced approximately 5.55 inches of rain on 6/14.	
6/4/2007	6/3/2007	Result of 1.5' rainfall event. Wrack lines noted.	None
10/15/2008	4/27/2008	According to NCDC Station Coop ID 313123 - Louisburg NC , 2.15 inches of precipitation fell over this 24 hour period. It was assumed, but not verified, that this rainfall produced a bankfull event.	None
10/15/2008	9/6/2008	According to NCDC Station Coop ID 313123 - Louisburg NC , 3.27 inches of precipitation fell over this 24 hour period. It was assumed, but not verified, that this rainfall produced a bankfull event.	None
1/27/2009	Unknown; but probably between the dates of January 5 and January 21, 2009.	Crest gauge reading of 6" on stick. Base of crest gauge (measuring stick) located at bankfull elevation. Date of bankfull flow unknown, but two 1+ inch precipitation events occurred between January 5 and January 27, 2009. Presumably, one of these two events caused the over-bank flow.	None
10/5/2010	Unknown. Likely between May and August 2010	Crest gauge reading above base, wrack lines observed during geomorphic survey. Two 2+ inch storm events occurred between May and August 2010.	None
