I. Executive Summary/Project Abstract

The North Carolina Wetland Restoration Program conducted a restoration on 5200 feet of Brown Branch stream footage. Brown Branch is located in Caldwell County, North Carolina and within the Yadkin River Basin. The Brown Branch watershed comprises three square miles and is part of the Elk River drainage, eight-digit hydrologic unit code 06010103.

The project site is 3.5 miles east of U.S. Highway 321 at Happy Valley and 3.0 miles north of Olivette, NC. The Brown Branch restoration reach is entirely contained in the Anita-Alata 4H Camp and is the last mile of the creek before its confluence with Mulberry Creek.

The purpose of this restoration project was to improve water quality in Brown Branch by reducing the severe bank erosion. The stream features that motivated the restoration project were an unstable channel configuration, a featureless bed, a lack of riparian cover. These features caused poor water quality and aquatic habitat.

The goals of the Brown Branch restoration project were to establish a stable plan form, create cross-sectional and profile patterns that will enhance in-stream habitat and water quality, and to improve the functional and aesthetic value of the riparian corridor. The design increased the sinuosity of the channel and incorporated rock and log structures to decrease erosive stress on the banks and provide increased aquatic habitat. By creating a range of aquatic niches, the project intends to provide in-stream habitats that may support future trout populations.

A previous monitoring report (May 2004) covered the period from end of construction (September 2002) through the first year post-construction. This report noted extensive channel damage due to heavy rains and high flows that occurred during the first year. Most of these noted problems are still apparent because they were not considered significant enough to result in a critical failure and lack of achieving project goals status. The second monitoring period was conducted by North Carolina State University. EcoLogic obtained some of this data and photographs from NCSU Stream Restoration Institute, but no final report was provided to EcoLogic. Due to lack of information, as noted in Table 11, EcoLogic had little information about the design issues or as-built condition.

Without the past design or monitoring history, it is difficult to judge the performance of this restoration project. EcoLogic ascertained the problem issues with the restoration project, however without the historical information, it is not possible to determine if the problem areas are stable, improving, or declining. A current condition determination would require more time to directly contact the designers and previous monitoring teams and obtain the historical data. This demonstrates the need to maintain continuity of monitoring data. This may be accomplished by consistently using the same environmental firm to conduct the annual monitoring on specific streams and clearly defining the monitoring protocols. This would allow NC EEP to gather coherent data

that is comparable among years and make objective assessment of projects such as Brown Branch.

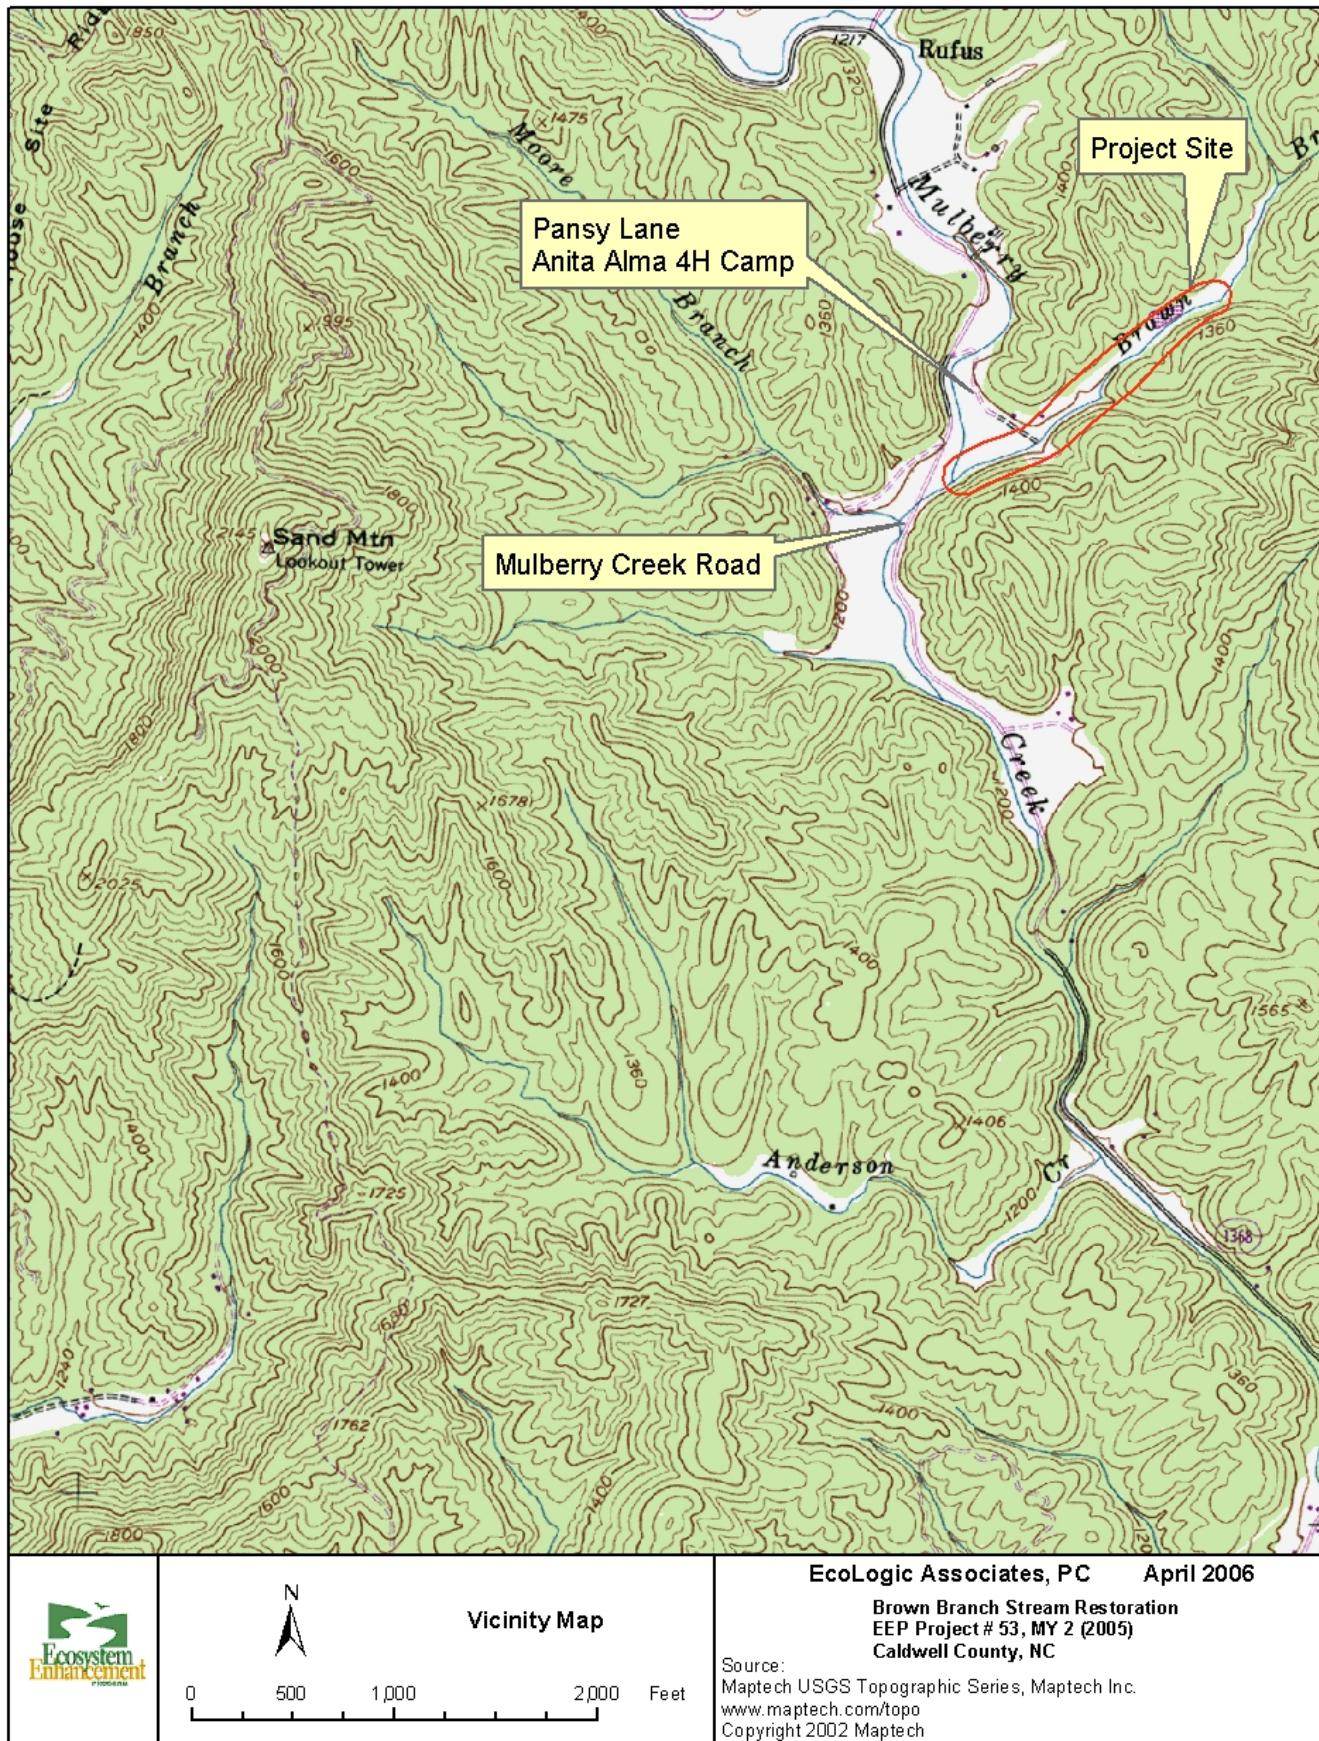

II. Project Background

1. Location and Setting

The North Carolina Wetland Restoration Program conducted a restoration on 5200 feet of Brown Branch stream footage. Brown Branch is located in Caldwell County, North Carolina and is within the Yadkin River Basin. The Brown Branch watershed comprises three square miles and is part of the Elk River drainage, eight-digit hydrologic unit code 06010103.

The project site is 3.5 miles east of Hwy 321 at Happy Valley and 3.0 miles north of Olivette, NC. The Brown Branch restoration reach is entirely contained in the Anita-Alata 4H Camp and is the last mile of the creek before its confluence with Mulberry Creek. The restoration starts immediately downstream from the confluence of two-first order tributaries. The creek flows generally west, along the length of the valley. The restoration reach follows the southern edge of the small valley with a forested hillside along the south bank (river left) and the 4H Campground, a pond and pasture along the north bank (river right).

There is a fence line that separates the grazing pastures in the lower floodplain from the riparian easement. Further up the valley there is no grazing, so no fencing was installed. The camp manager mows the campground, but does not mow the riparian buffer. Except for the difference in vegetation, there are some areas where the easement boundary is not well marked. The camp manager requested that the boundary markers be improved and made easily visible and permanent.

2. Structure and Objectives

The purpose of this restoration project was to improve water quality in Brown Branch by reducing the severe bank erosion. The stream features that motivated the restoration project were an unstable channel configuration, a featureless bed, a lack of riparian cover. These features caused poor water quality and aquatic habitat.

The goals of the Brown Branch restoration project were to establish a stable plan form, create cross-sectional and profile patterns that will enhance in-stream habitat and water quality, and to improve the functional and aesthetic value of the riparian corridor. The design increased the sinuosity of the channel and incorporated rock and log structures to decrease erosive stress on the banks and provide increased aquatic habitat. By creating a range of aquatic niches, the project intends to provide in-stream habitats that may support future trout populations.

The design increased the sinuosity of the channel and incorporated rock and log structures to decrease erosive stress on the banks and provide increased aquatic habitat.

3. Project History and Background

This stream restoration project was constructed in the summer of 2003 with construction complete in September 2002. At that time an as-built survey was conducted by the design firm Biohabitats, Inc. In October 2003, data was collected by Biohabitats, Inc. and used to produce a one-year monitoring document that is dated May 2004. The first year monitoring document included a list of project performance standards that addressed channel morphology, channel bed substrate and vegetative survival. Due to the heavy rains and resultant high flows during fall 2003, there were problems noted which included erosion behind some structures, and bank failure and erosion on some of the constructed bankfull benches. All of these problems were localized and none were seen as a systemic problem. No repair work was conducted. All of these problem areas were marked as “continue to monitor.”

The present monitoring report collected data during two site visits during summer 2005. This current report is monitoring year number three.

III. Project Condition and Monitoring Results

A. Vegetation Assessment

1. Soil Data

The soils along Brown Branch are classified as Cullowhee loam with characteristic very deep profiles, frequent flooding and a slope of less than 3%. These soils have somewhat poor drainage but rapid permeability and a low shrink swell potential. The seasonal high water table appears between 1.5 and 2.0 feet and these soils have very low erosion potential. The surface contains significant amounts of organic material and is typically

6. Quantitative Morphology

No crest gages are installed at this site to document bankfull events. Therefore, potential occurrence was extrapolated based on USGS stream gage discharge data for the Yadkin River near Patterson, NC. The gage is located about four (4) miles from the project site in a different watershed and has a drainage area of 28.8 square miles. An estimate of the number of bankfull events in 2005 was made by comparing the stream discharges from the USGS data in cubic feet per second (cfs) against the bankfull discharge estimated from the drainage area on the Rural Piedmont Regional Curve. According to the regional curve, a bankfull event occurs on a stream with a 28.8-mi² drainage area when the discharge is about 1,000 cfs. Based on this secondary surrogate USGS data, an estimated one (1) bankfull event occurred in 2005.

Please see pages 11-12 for tables XI and XII.

IV. Methodology Section

The methods used to generate the data in this monitoring report are standard fluvial geomorphology techniques as described in *Applied River Morphology*, 1996, D.L. Rosgen and related publications from US Forest Service and the interagency Stream Mitigation Guidelines, 2003, USACOE, USEPA, NCWRC, NCDENR-DWQ.

EcoLogic's field morphology survey was conducted using a Nikon total station and the data was analyzed and displayed using RiverMorph version 3.1 software. The pebble counts were conducted using Pocket RiverMorph software and a PDA. The vegetation problem areas and structural problem areas were noted in the field on the PDA.

Photographs were taken at medium-high resolution using a Nikon Coolpix 4600 digital camera.

GPS location information was collected using a Trimble Geo XT handheld mapping grade GPS unit. GPS locations were collected on all problem areas, photo points and at least one corner of each vegetation-monitoring plot.

Vegetation monitoring plots were marked in the field by placing a steel conduit with blue flagged at each corner. In addition, the up-stream, outside corner was marked with a three-foot length of white plastic pipe tied with orange flagging. Individual plants in the monitoring plots were tied with white flagging.

Appendix A. 1

Project:
 Brown Branch Stream Restoration
 Caldwell County, NC
Prepared For:
 NC Ecosystem Enhancement Program

Project Number:
 53
Map Title:
 Veg PAPV
Monitoring Year:
 3 (2005)
Date:
 2/27/06
Figure Number:
 2

Appendix A. 2

Raw Data - Stem Counts	
EEP Project #: 00053	Date: 8/31/2005
Project Name: Brown Branch	Staff Name Moni Bates
Monitoring Contractor: EcoLogic	Staff Name Darrell Timpany
County: Caldwell	Staff Name
8 Digit Catalog Unit: 03030005	Staff Name
Stream/Wetland Name: Brown Branch	Staff Name

Table B1. Qualitative Visual Stability Assessment						
Project Number: 00053						
Segment/Reach: Brown Branch						
Feature Category	Metric (per As-built and reference baselines)	(# Stable) Number Performing as Intended	Total number per As-built	Total Number / feet in unstable state	% Perform in Stable Condition	Feature Perform. Mean or Total
A. Riffles	1. Present?	32	32	0	100	
	2. Armor stable (e.g. no displacement)?	32	32	0	100	
	3. Facet grade appears stable?	32	32	0	100	
	4. Stable interval grade?	32	32	0	100	
	5. Feature spacing appropriate?	32	32	0	100	
	6. Minimal evidence of embedding/fining?	32	32	0	100	
	7. Depth appears appropriate for current discharge?	32	32	0	100	
	8. Length appropriate?	32	32	0	100	
						100
B. Pools	1. Present? (e.g not subject to severe aggradation?) 4	38	38	0	100	
	2. Sufficiently deep (Max Pool D:Mean Bkf >1.6?)	38	38	0	100	
	3. Thalweg located outer bend?	34	38	4/235	89	
	4. Spacing appropriate?	38	38	0	100	
	5. Non-aggrading (not filling)?	38	38	0	100	
	6. Length appropriate?	38	38	0	100	
C. Thalweg	1. Upstream of meander bend (run/inflection) centering?	38	38	0	100	
	2. Downstream of meander (glide/inflection) centering?	35	38	2/52	92	
D. Meanders	1. Outer bend in state of limited/controlled erosion?	30	30	0	100	30
	2. Of those eroding, # w/ concomitant point bar formation?	0	NA	0	NA	NA
	3. Apparent Rc within spec?	NA	NA	0	NA	NA
	4. Sufficient floodplain access and relief?	30	30	0	100	30
E. Bed	1. General channel bed aggradation areas (bar formation)	4	NA	0	NA	
General	2. Channel bed degradation – areas of increasing down-cutting or head cutting?	All	NA	None	100	NA
F. Channel Capac./Dimen.	1. Channel width: depth appears out of design/type spec?	All	NA	None	100	NA
G. Banks	1. Apparent scour points from channel processes	Yes	NA	15/155	NA	
	2. Apparent cut points from overland flow	1	NA	0	NA	
	3. Apparent cut or scour from flood water re-entry to channel (e.g. inadequate floodplain access?)	Yes	NA	1/10	NA	NA
	4. Tension cracks	All	NA	None	100	NA
	5. Unstable cantilever blocks (e.g. height/undercut/soil type versus vegetation penetration and extent)	2	NA	0	NA	NA
	6. Bank gradient in excess of 40%?	All	NA	None	100	NA
	7. Collapse/slumping	3	NA	0	NA	NA
	8. Ratio of bank height: bankfull height elevated	All	NA	None	100	NA
H. Vanes	1. Free of back or arm scour?	52	52	1	100	52
	2. Height appropriate?	52	52	0	100	52
	3. Angle and geometry appear appropriate?	52	52	0	100	52
	4. Free of piping or other structural failures?	51	52	1/52	NA	NA
I. Wads/ Boulders	1. Free of scour?	40	44	4	NA	NA
	2. Footing stable?	30	34	4	NA	NA
	NA: Historical project documents necessary to provide this data were unavailable at the time of this report submission.
