1.0 EXECUTIVE SUMMARY

Michael Baker Engineering, Inc. (Baker) restored 8,213 linear feet (LF) of perennial stream, enhanced 2,481 LF of stream, and preserved 518 LF of stream along Hurricane Creek (HC) and unnamed tributaries (UT4) to Brown Creek, a 303(d) listed stream that flows through the Pee Dee National Wildlife Refuge. Baker also planted approximately 33 acres (AC) of native riparian vegetation along the restored and enhanced reaches (Reaches HC-R1, HC-R2, and HC-R3 on the Hurricane Creek portion of the project, and UT4-R1a, UT4-R1b, UT4-R2, UT4-R3, UT4-R4a, UT4-R4b, UT4-R5a, and UT4-R5b on the unnamed tributary (UT4) portion of the project). A recorded conservation easement consisting of 43.3 acres protects and preserves all stream reaches, existing wetland areas, and riparian buffers in perpetuity. The Brown Creek Tributaries Restoration Project (Site) is located in Anson County, approximately four miles southeast of the Town of Ansonville (Figure 1). The Site is located in the NC Division of Water Resources (NCDWR) subbasin 03-07-10 and the NC Division of Mitigation Services (DMS) Targeted Local Watershed (TLW) 03040104-061030 of the Yadkin River Basin. The project involved the restoration and enhancement of a rural piedmont stream system (Schafale and Weakley 1990), which had been impaired due to past agricultural conversion and cattle grazing.

Based on the DMS 2009 Lower Yadkin-Pee Dee River Basin Restoration Priority (RBRP) Plan, the Brown Creek Tributaries Restoration Project area is located in an existing targeted local watershed (TLW) within the Yadkin River Basin, although it is not located in a Local Watershed Planning (LWP) area. The TLW selection criteria for the Yadkin Basin specifically targets projects that will address water resource impacts from nonpoint source (NPS) pollution. The restoration strategy for the Yadkin River Basin as a whole targets projects which focus on restoring stream functions by maintaining and enhancing water quality, restoring hydrology, and improving fish and wildlife habitat.

The primary goals of the project were to improve ecologic functions to the impaired areas as described in the DMS 2009 Lower Yadkin-Pee Dee RBRP as identified below:

- Create geomorphically stable conditions along the unnamed tributaries across the site,
- Implement agricultural BMPs to reduce NPS inputs to receiving waters,
- Protect and improve water resources by reducing stream bank erosion, and nutrient and sediment inputs,
- Restore stream and floodplain interaction by connecting historic flow paths and promoting natural flood processes, and
- Restore and protect riparian buffer functions and corridor habitat in perpetuity by establishing a
 permanent conservation easement.

To accomplish these goals, the following objectives were identified:

- Restore existing incised, eroding, and channelized streams by providing them access to their relic floodplains,
- Prevent cattle from accessing the conservation easement boundary by installing permanent fencing and thus reduce excessive stream bank erosion and undesired nutrient inputs,
- Increase aquatic habitat value by providing more bedform diversity, creating natural scour pools and reducing sediment from accelerated stream bank erosion,

- Plant native species riparian buffer vegetation along stream bank and floodplain areas, protected by a permanent conservation easement, to increase stormwater runoff filtering capacity, improve stream bank stability and riparian habitat connectivity, and shade the stream to decrease water temperature,
- Improve aquatic and terrestrial habitat through improved substrate and in-stream cover, addition of woody debris, and reduction of water temperature, and
- Control invasive species vegetation within the project area and, if necessary, continue treatments during the monitoring period.

The Year 1 monitoring survey data of the fifteen cross-sections indicates that those stream sections are stable and are within the lateral/vertical stability and in-stream structure performance categories. Most reaches are geomorphically stable and performing as designed, as confirmed by the visual stability assessment. However, there were a few concerns noted on reaches UT4-R2, as well as one each on UT4-R3 and UT4-R4b. Reach UT4-R2 has significant scour on three riffle sections; their beds are degrading along their entire length. Headcuts have also formed along the thalweg in two of the riffles in their downstream sections, scouring and lengthening the downstream pools. These riffles were earth/sand riffles and were therefore more vulnerable to the scouring potential of high storm flows. There were also two additional areas of bank scour noted for this reach as well. For UT4-R3, the log vane located at the top of the reach at the confluence of UT4-R4b and UT4-R2 was undermined and washed out, along with a portion of the adjacent bank. Additionally, the right bank of the rock ford crossing on UT4-R4b washed out. It is believed that the harsh fall and winter rainstorms of 2015 (in particular Hurricane Joaquin in early October) damaged the site before it had time to establish protective vegetation cover. All of these stream problem areas will be corrected during the summer of 2016 by Riverworks personnel. The location and photographs for all of the stream problem areas can be found in Appendix B.

During Year 1 monitoring, the planted acreage performance categories were functioning at 100 percent with no bare areas or low stem density areas to report. The average density of total planted stems, based on data collected from the sixteen monitoring plots during Year 1 monitoring, is 716 stems per acre. The Year 1 data demonstrate that the Site is on track for meeting the minimum success interim criteria of 320 trees per acre by the end of Year 3.

Invasive species areas of concern were observed and documented accordingly. Following Year 1 monitoring, two areas along HC-R3 were found to contain sparse numbers of young resprouts of the invasive species Chinese privet (*Ligustrum sinsense*). The areas total approximately 0.1 acres and are located within the non-planted buffer along the right bank of HC-R3 that was already forested. This area of invasive species will be closely observed through Year 2 monitoring and any changes will be documented in the Year 2 monitoring report. No other areas were found to contain invasive species at this time.

In-stream flow for the restored channels of UT4 were recorded in 2015 by the use of two flow gauges (pressure transducers) located along reaches UT4-R1b and UT4-R4b. The flow gauges documented seasonal flow for Year 1 through these reaches of 92.0 and 37.0 consecutive days, respectively. It is also noted that the flow gauges demonstrated similar flow events relative to recorded rainfall events on site as demonstrated in the gauge graphs in Appendix E.

Two bankfull crest gauges are located along UT4-R2 and HC-R2. During Year 1 monitoring, both crest gauges documented at least one post-construction bankfull event.

Summary information/data related to the Site and statistics related to performance of various project and monitoring elements can be found in the tables and figures in the report Appendices. Narrative background and supporting information formerly found in these reports can be found in the Baseline Monitoring Report and in the Mitigation Plan available on the North Carolina Division of Mitigation Services (NCDMS) website. Any raw data supporting the tables and figures in the Appendices are available from NCDMS upon request.

This report documents the successful completion of Year 1 monitoring activities for the post-construction monitoring period.

2.0 METHODOLOGY

The seven-year monitoring plan for the Site includes criteria to evaluate the success of the stream and vegetation components of the project. The methodology and report template used to evaluate these components adheres to the DMS monitoring report template guidance document Version 1.3 (dated January 15, 2010), which will continue to serve as the template for subsequent monitoring years. The vegetation monitoring quadrants follow CVS-DMS monitoring levels 1 and 2 in accordance with CVS-DMS Protocol for Recording Vegetation, Version 4.1 (2007).

Stream survey data was collected to a minimum of Class C Vertical and Class A Horizontal Accuracy using a Leica TS06 Total Station and was georeferenced to the NAD83 State Plane Coordinate System, FIPS3200 in US Survey Feet, which was derived from the As-built Survey. This survey system collects point data with an accuracy of less than one tenth of a foot.

The specific locations of monitoring features, such as vegetation plots, permanent cross-sections, flow gauges, and crest gauges are shown on the CCPV sheets found in Appendix B.

The Year 1 vegetation data were collected in November 2015, while the cross-section survey data were collected in February 2016. The delayed survey effort was conducted with DMS permission to fulfill the 180-day requirement between the post-construction as-built survey and the monitoring Year 1 survey work (the as-built survey data was collected in July 2015). Visual site assessment data contained in Appendix B were collected in November and December of 2015, and February of 2016.

2.1 Stream Assessment

The project involved the restoration and enhancement of a rural piedmont stream system (Schafale and Weakley 1990), which had been impaired due to past agricultural conversion and cattle grazing. Restoration practices involved raising the existing streambed and reconnecting the stream to the relic floodplain to restore natural flow regimes to the system. The existing channels abandoned within the restoration areas were partially to completely filled to decrease surface and subsurface drainage and to raise the local water table. Permanent cattle exclusion fencing was provided around all proposed reaches and riparian buffers in which cattle previously had access.

2.1.1 Morphologic Parameters and Channel Stability

Cross-sections were classified using the Rosgen Stream Classification System (Rosgen 1994) and all monitored cross-sections fall within the quantitative parameters defined for channels of their design stream type. Cross-sections were also compared to the baseline cross-section plots to evaluate change between construction and the MY1 survey. Morphological survey data is presented in Appendix D.

The Year 1 monitoring survey data of the fifteen cross-sections indicates that the Site is geomorphically stable and performing at 100 percent for all the parameters evaluated. The data collected are within the lateral/vertical stability and in-stream structure performance categories. Most reaches are stable and performing as designed, as confirmed by the visual stability assessment. However, there were a few concerns noted on reaches UT4-R2, as well as one each on UT4-R3 and UT4-R4b. Reach UT4-R2 has three riffle sections that are exhibiting scour. Their beds are degrading, headcuts have formed along

the thalweg in two of the riffles, and the banks are now being undermined. The riffles were earth/sand riffles and were therefore more vulnerable to the scouring potential of high storm flows. There were also two areas of bank scour noted for this reach as well. For UT4-R3, the cross vane located at the top of the reach at the confluence of UT4-R4b and UT4-R2 was undermined and washed out along with a portion of the adjacent bank. Additionally, the right bank of the rock ford crossing on UT4-R4b washed out. It is believed that the harsh fall and winter rainstorms of 2015 (in particular Hurricane Joaquin in early October) damaged the site before it had time to establish protective vegetation cover. All of these stream problem areas will be corrected during the summer of 2016 by Riverworks personnel. The location and photographs of the stream problem areas can be found in Appendix B.

A longitudinal profile was surveyed for the entire length of each channel after construction to document the as-built baseline conditions for Monitoring Year 0 only. Annual longitudinal profiles will not be conducted during subsequent monitoring years unless channel instability has been documented or redmedial actions/repairs are required by the US Army Corps of Engineers (USACE) or DMS.

2.1.2 Hydrology

Total observed rainfall at the Anson County airport (KAFP) weather station located near Wadesboro, NC for the period of January 2015 through December 2015 was 42.47 inches. The WETS table for Anson County was used to calculate the 30-year average, and was found to be 47.03 inches. Thus, according to the KAFP weather station, for the period January 2015 through December 2015 the total rainfall during the Year 1 monitoring was 4.56 inches below the historic approximated average.

The occurrence of bankfull events within the monitoring period are documented by the use of two crest gauges, as well as photographs. One crest gauge is installed at bankfull elevation along on HC-R2 and a second crest gauge is installed along UT4-R2. Each gauge recorded at least one bankfull event during Year 1 monitoring. Crest gauge readings are presented in Appendix E.

To document seasonal flow in restored intermittent channels, two automated flow gauges (pressure transducers) are installed in the UT4 site. The flow gauges are installed along UT4-R1b and UT4-R4b and programmed to collect data every 6 hours. Success criteria are considered to have been met if 30 consecutive days of flow were observed at any point during the monitoring year. Year 1 monitoring results indicate that both UT4 flow gauges met the minimum consecutive days of surface flow required for success. The recorded flow data and observed rainfall graphs for each gauge, along with the flow gauge success summary are located in Appendix E.

2.1.3 Photographic Documentation

Reference photograph transects were taken at each permanent cross-section during the survey work in February 2016. The survey tape was centered in the photographs of the bank. The water line was located in the lower edge of the frame, and as much of the bank as possible is included in each photograph.

Representative photographs for Monitoring Year 1 were taken along all reaches for both the Hurricane Creek and UT4 project sites during October, November, and December 2015 site visits.

Stream flow cameras located on UT4-R4b and HC-R2 provided further documentation of seasonal flow. However, the camera on HC-R2 had persistent difficulties with vegetation obstruction at its original location, preventing the collection of useful photographs, so it was moved slightly downstream to Station 35+25 in October 2015.

The photographs of stream reaches, flow cameras, vegetation plots, monitoring gauges (both crest and flow gauges), and stream and vegetation problem areas are all located in Appendix B.

2.2 Vegetation Assessment

In order to determine if the criteria are achieved, vegetation-monitoring quadrants were installed and are monitored across the restoration site in accordance with the CVS-DMS Protocol for Recording Vegetation, Version 4.1 (2007) and the CVS-DMS data entry tool v 2.3.1 (2012). The vegetation monitoring plots were established randomly throughout the planted riparian buffer areas of UT4 and Hurricane Creek as per Monitoring Levels 1 and 2. The size of each individual quadrants are 100 square meters for woody tree species.

Based on the Year 1 vegetation plot monitoring data collected during November 2015, the average planted stem density is 716 stems per acre. Thus, the vegetation data demonstrate that the project is on track for meeting the minimum success criteria of 320 trees per acre by the end of Year 3.

Year 1 vegetation assessment information is provided in Appendices B and C.

2.2.1 Vegetation Concerns

Invasive species areas of concern were observed and documented accordingly. Following Year 1 monitoring, two areas along HC-R3 were found to contain the invasive species Chinese privet (*Ligustrum sinsense*). The areas total approximately 0.1 acres and are located within the non-planted buffer along the right bank of HC-R3 that was already forested. The area is currently only sparsely populated with young re-sprouts, so no treatment action is recommend at this time, however, this area of invasive species will be closely observed throughout Year 2 monitoring and any changes will be documented as necessary.

No other areas of concern regarding the existing vegetation were observed along the Hurricane Creek or UT4 sites. Year 1 vegetation assessment information is provided in Appendix C.

Table 5b. Stream Problem Areas (SPAs)

Brown Creek Tributaries Restoration Project: DMS Project ID No. 95351

SPA#	Feature Issue	Reach ID, Station Number	Suspected Cause	Photo # in Problem area Photo Log	
1	Log J-Hook failure	UT4-R3, 29+00	Overbank flows from fall and winter storms ¹	1	
2	Bank erosion	UT4-R2, 37+40	Overbank flows from fall and winter storms ¹	2	
3	Ford crossing washed out	UT4-R4, 25+30	Overbank flows from fall and winter storms ¹	3	
4	Riffle scour	UT4-R2, 31+00	Overbank flows from fall and winter storms ¹	4	
5	Riffle scour	UT4-R2, 28+75	Overbank flows from fall and winter storms ¹	5	
6	Riffle scour	UT4-R2, 24+00	Overbank flows from fall and winter storms ¹	6	
7	Bank erosion	UT4-R2, 23+10	Overbank flows from fall and winter storms ¹	6	
8	Scour in floodplain	UT4-R2, 21+40 to 21+75	Overbank flows from fall and winter storms ¹	7, 8	

Note:

¹ The overbank flows from Hurricane Joaquin on Oct 2-3, 2015 contributed to the initial destabilization of the listed structures, banks, and floodplain area. Subsequent storm events of equal or greater size on November 2nd and 19th, and on December 30th continued the scour and structure damage. The SPAs resulted from an accumulation of these high flow events that cannot be attributed to any single large storm.

Table 6a. Vegetation Conditions Assessment									
Brown Creek Tributaries Restoration Project: DMS Project ID No. 95351									
Planted Acreage: 33.5									
Vegetation Category	Defintions	Mapping Threshold (acres)	CCPV Depiction	Number of Polygons	Combined Acreage	% of Planted Acreage			
1. Bare Areas	Very limited cover both woody and herbaceous material.	0.1	NA	0	0.00	0.0%

Brown Creek Tributaries Restoration Project: DMS Project ID No. 95351

Report Prepared ByDwayne Huneycutt **Date Prepared**4/4/2016 15:34

database name MichaelBaker_2015_BrownCrkTribs_95351.mdb

database location L:\Monitoring\Veg Plot Info\CVS Data Tool\Brown Crk Tribs

computer name CARYLDHUNEYCUTT file size 59568128

DESCRIPTION OF WORKSHEETS IN THIS DOCUMENT-----

MetadataDescription of database file, the report worksheets, and a summary of project(s) and project data.Proj, plantedEach project is listed with its PLANTED stems per acre, for each year. This excludes live stakes.

Proj. total stems Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems.

Plots List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.).

 Vigor
 Frequency distribution of vigor classes for stems for all plots.

 Vigor by Spp
 Frequency distribution of vigor classes listed by species.

Damage List of most frequent damage classes with number of occurrences and percent of total stems impacted by each.

Damage by SppDamage values tallied by type for each species.Damage by PlotDamage values tallied by type for each plot.

Planted Stems by Plot and Spp A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded.

PROJECT SUMMARY-----

Hydrologic Data

Figure 5.

^{*} Surface water flow is estimated to have occurred when the pressure transducer reading is equal to or above 0.5 inches in depth.

Flow Gauge ID	Consecutive Days of Flow ¹	Cumulative Days of Flow ²
	UT4 Reach 4 Flow Gauge	
BTFL1	37.0	83.0
	UT4 Reach 2 Flow Gauge	
BTFL2	92.0	97.0
Notes:		
¹ Indicates the number of consecutive	days within the monitoring year who	ere flow was measured.
² Indicates the number of cumulative	days within the monitoring year when	re flow was measured.
BTFL1 was installed on 7/17/2015 at was installed on 8/17/2015 and recor		•
Surface water flow is estimated to ha depth.	ve occurred when the pressure transd	lucer reading is ≥0.5 inches in
Flow success criteria for the Site: A the flow duration occurs for a minim		ered at least intermittent when

	Gauge Success (2015) ributaries Restoration Project: DM	IS Project ID No. 95351
