Signature & Date of Official Approving Credit Release

- $\ensuremath{\mathbf{1}}$  For NCDMS, no credits are released during the first milestone
- 2 For NCDMS projects, the initial credit release milestone occurs automatically when the as-built report (baseline monitoring report) has been made available to the IRT by posting it to the DMS portal, provided the following have been met:
- 1) Approved of Final Mitigation Plan
- 2) Recordation of the preservation mechanism, as well as a title opinion acceptable to the USACE covering the property.
- 3) Completion of all physical and biological improvements to the mitigation site pursuant to the mitigation plan.
- 4) Receipt of necessary DA permit authorization or written DA approval for projects where DA permit issuance is not required.
- 3 A 10% reserve of credits is to be held back until the bankfull event performance standard has been met.

RE: Cochran Branch Stream and Wetland Restoration Site: MY5 Monitoring Report (NCDMS ID 95720)

Listed below are comments provided by DMS on November 24, 2020 regarding the Cochran Branch Stream and Wetland Restoration Site: Year 6 Monitoring Report and RES' responses.

**General:** RES should discuss and coordinate with the IRT before completing additional herbicidal treatment of the vegetation along Parrish Branch during monitoring year 7 (2021). The IRT may request that the site be unmaintained in the final year of monitoring. The draft report notes that Parrish branch is no longer considered a problem area and Table 5 currently indicates that no significant aggradation was observed on the reach in MY6. As a reminder, at the April 2020 IRT credit release meeting, the IRT requested a site visit in late fall/ winter 2020/2021 to observe Parrish Branch during the dormant season.

RES plans to discuss herbicidal treatment of vegetation in Parrish Branch with the IRT during the requested early 2020 site visit.

**General:** Please confirm that the conservation easement signage marking the site was assessed and repaired as necessary during MY6 (2020). Please include report text as necessary. Conservation easement signage was assessed during annual monitoring and no repairs were deemed necessary. RES will assess the easement signage again in MY7 and ensure the site is properly marked prior to closeout. This has been added to the report.

**CCPV Map (Figure 2) & Table 6:** No invasive areas are shown on the CCPV map or reported in Table 6. Please confirm that current invasives on the site are beneath the mapping threshold (1,000 SqF) or revise the CCPV map and table as necessary.

RES did not observe any areas of invasives larger than the mapping threshold.

**Table 9 – Planted Stem Count Totals**: The table indicates that no volunteer stems were identified in the vegetation plots during MY6 (2020). Please confirm or update the report as necessary.

RES did not record any volunteer species during vegetation monitoring in MY6.

#### **Digital Support File Comments:**

• Last year DMS requested shapefiles that accurately represented Cochran Branch, and the design shapefiles were provided. However; these shapefiles characterize Cochran Branch as

being 1446 ft compared to the 1387 ft reported in the asset table. If possible, please provide DMS with shapefiles that accurately represent the linear feet reported in the asset table. The stream shapefile that has the accurate linear feet is included with the support files. The 59-foot difference was due to a utility easement at the top of Cochran Branch where no credit is received.

• Please include photos from permanent stations as JPEGs in the final digital submission. Done.

#### 1.0 PROJECT SUMMARY

#### 1.1. Goals and Objectives

The overall goals address the stressors identified in the TLW and include the following:

- Improve water quality within the restored channel reaches and downstream watercourses by reducing sediment and nutrient inputs and increasing dissolved oxygen levels
- Improve local aquatic and terrestrial ecological function through increased stream shading, habitat complexity, and availability of organic/woody material
- Improve aquatic and benthic habitat and associated streambed form
- Improve site hydrology, wetland functions, and attenuation of flood flows
- Provide riparian area and wetland restoration with a native plant community
- Protect the site from future land impacts

The specific project objectives that are intended to target the above goals include the following:

- Implement Priority I and II restoration of 1,783 feet of stream and rehabilitation/re-establishment of 4.35 acres of wetlands
- Implement appropriate changes in dimension, pattern and/or profile to establish geomorphically stable conditions within the project reaches
- Modify degraded stream channels to enable proper sediment transport capacity and improved streambed form
- Integrate in-stream structures and native bank vegetation
- Re-grade the floodplain to remove drainage ditches, spoil berms, and overburden soil
- Plant native woody and herbaceous riparian vegetation within a minimum width of 30 feet from the edge of the restored channels and throughout the restored wetland area
- Eradicate invasive, exotic or undesirable plant species
- Install livestock exclusion fencing
- Establish a permanent conservation easement

#### 1.2. Success Criteria

#### 1.2.1. Morphological Parameters and Channel Stability

Restored and enhanced streams are in compliance with the standards set forth in the USACE 2003 Stream Mitigation Guidelines and the "Ecosystem Enhancement Program Monitoring Requirements and Performance Standards for Stream and Wetland Mitigation" dated November 7, 2011. Restored and enhanced streams should demonstrate morphologic stability to be considered successful. Stability does not equate to an absence of change, but rather to sustainable rates of change or stable patterns of variation. Restored streams often demonstrate some level of initial adjustment in the several months that follow construction and some change/variation subsequent to that is also to be expected. However, the observed change should not be unidirectional such that it represents a robust trend. If some trend is evident, it should be very modest or indicate migration to a stable form.

**Dimension -** Cross-section measurements should indicate little change from the as-built cross-sections. If changes do occur, they will be evaluated to determine whether the adjustments are associated with increased stability or whether they indicate movement towards an unstable condition.

**Pattern and Profile -** Visual inspection of the pattern and profile should indicate stability with little deviation from as-built conditions for the restored stream. Pool depths may vary from year to year, but the majority should maintain depths sufficient to be observed as distinct features. The pools should maintain their depth with flatter water surface slopes,

while the riffles should remain shallower and steeper. Pattern and profile measurements will not be collected unless conditions seem to indicate that a detectable and detrimental change appears to have occurred.

**Substrate** - Calculated  $D_{50}$  and  $D_{84}$  values should indicate coarser size class distributions of bed materials in riffles and finer size class distributions in pools. The majority of riffle pebble counts should indicate maintenance or coarsening of substrate size class distributions. Generally, it is anticipated that the bed material will coarsen over time.

**Sediment Transport -** Depositional features should be consistent with a stable stream that is effectively managing its sediment load. Point bar and inner berm features, if present, should develop without excessive encroachment of the channel. Isolated development of robust (i.e. comprised of coarse material and/or vegetated actively diverting flow) mid-channel or lateral bars will be acceptable. Likewise, development of a higher number of mid-channel or lateral bars that are minor in terms of their permanency such that profile measurements do not indicate systemic aggradation will be acceptable, but trends in the development of robust mid-channel or alternating bar features will be considered a destabilizing condition and may require intervention or have success implications.

#### 1.2.2. Surface Water Hydrology

Monitoring of stream surface water stages should indicate recurrence of bankfull flow on average every 1 to 2 years. At a minimum, throughout the monitoring period, the surface water stage should achieve bankfull or greater elevations at least twice. The bankfull events must occur during separate monitoring years.

#### 1.2.3. Groundwater Hydrology

The USACE defines minimum hydrology for jurisdictional wetlands to be saturation within 12 inches of the surface for at least 5% of the growing season if soils and vegetation meet jurisdictional criteria. Given that hydric soils are present throughout the restoration area but that wetland vegetation will be newly established, it is reasonable to set the minimum hydrology threshold slightly above the jurisdictional minimum threshold. As such, the minimum performance standard is set to provide saturated soils within 12 inches of the surface for at least eight percent (8%) of the growing season under average climatic conditions. The reference wetland site used up through 2017 was the NCDMS Cat Creek Stream and Wetland Restoration Site – NCDMS Project # 71 – located east of Franklin in Macon County, NC. In January 2018, RES made a site visit to Cat Creek to replace the wetland reference gauge, but it was determined that it was no longer a representative reference gauge due to its location in a beaver pond. Because of the continued success of the wetland gauges on the Cochran Branch Site (including those gauges outside of the wetland crediting area), RES deemed it unnecessary to find a new location for the reference gauge. The growing season for the site was based on the Natural Resource Conservation Service (NRCS) WETS dataset for Macon County (http://agacis.rccacis.org/37113/wets). The Macon County dataset is based on a site with elevations roughly the same as the project site. According to NRCS, the growing season for Macon County is defined to be the period with a 50% probability that the daily minimum temperature is higher than 28°F. At the project site, this period extends from April 16<sup>th</sup> to October 19<sup>th</sup> for a total of 187 days. Based on this, wetland hydrology success will be achieved if the water table is within 12 inches of the soil surface for one or more periods of at least 15 consecutive days during the growing season.

#### 1.2.4. Vegetation

Riparian vegetation monitoring shall be conducted for a minimum of seven years to ensure that success criteria are met per USACE guidelines. Accordingly, success criteria will consist of a minimum survival of 260 planted stems per acre by the end of the Year 5 monitoring period and a minimum of 210 planted stems per acre at the end of Year 7. If monitoring indicates either that the specified survival rate is not being met or the development of detrimental conditions (i.e., invasive species, diseased vegetation), appropriate corrective actions will be developed and implemented. Additionally, planted vegetation must average 8 feet in height in each plot at year 7 (as defined in the USACE 2003). If this performance standard is met by year 5 and stem density is trending toward success (i.e., no less than 260 five-year old stems/acre) monitoring of vegetation on the site may be terminated provided written approval is given by the USACE in consultation with the North Carolina Interagency Review Team (NCIRT).

#### 1.3. Project Setting and Background

The Cochran Branch Mitigation Project (The Site) is located approximately 6 miles northwest of Franklin, North Carolina at latitude 35°12'52" N and longitude 83°29'20" W. The Site encompasses approximately 10 acres of agricultural land and consists of two streams, Cochran Branch and Parrish Branch, along with 4.35 acres of wetlands on the Cochran Branch floodplain. The Site lies within the Little Tennessee River Watershed N.C. Division of Water Resources (DWR) sub-basin 04-04-01 and local HUC 06010202040020. The project is located within the NCDMS Iotla Creek targeted local watershed (TLW) and within the Franklin to Fontana local watershed plan (LWP). Cochran Branch drains to Burningtown Creek approximately 0.5 miles downstream of the project. Burningtown Creek is classified as B;Tr by NCDEQ.

Following 2016 monitoring the NCIRT requested a review of the differential between the Approved Mitigation Plan and Baseline Monitoring Report. The table below details the discrepancies by reach. The cause of increased baseline SMUs is survey methodology (thalweg vs. centerline) as well as construction field adjustments. The Mitigation Plan lengths were based on centerline. Wetland credits are unchanged from Mitigation Plan to Baseline Monitoring Report.

Reach	Mitigation Type*	Proposed Length (LF)	Mitigation Ratio	Proposed SMUs	Baseline SMUs
Cochran Branch	P1 Restoration	1,387	1:1	1,387	1,418
Parrish Branch	P1 Restoration	396	1:1	396	402
	Total	1.783		1.783	1.820

<sup>\*</sup>P1=Priority 1

#### 1.4. Project Performance

Monitoring Year 6 (MY6) data was completed in October 2020. Monitoring activities included visual assessment of all reaches and the surrounding easement, collection of images at eight permanent photo stations, and inventory of eight permanent vegetation monitoring plots. Monitoring activities also included stream monitoring consisting of the three cross-sections on Parrish Branch. Per the Approved Mitigation Plan, stream geomorphology monitoring was not required for MY6, however, RES wanted to present any changes to Parrish Branch post channel vegetation spraying. Conservation easement signage was assessed, and no repairs were deemed necessary. RES will assess the easement signage again in MY7 and ensure the site is properly marked prior to closeout

<sup>\*\*</sup>The contracted amount of credits for this Site was 1,756 SMUs

Summary information/data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the Baseline Monitoring Report (formerly Mitigation Plan) and in the Mitigation Plan (formerly Restoration Plan) documents available on the NCDMS website (https://deq.nc.gov/about/divisions/mitigation-services/dms-projects). All raw data supporting the tables and figures in the appendices is available from DMS upon request.

#### 1.4.1. Vegetation

Visual assessment of vegetation outside of the monitoring plots (**Appendix B; Table 6**) indicates that the herbaceous vegetation is becoming well established throughout the project. Treatments of Chinese privet (*Ligustrum sinense*) and multiflora rose (*Rosa multiflora*) have been effective along the boundary of the easement. A few multiflora rose patches were treated throughout the easement in July 2020.

Monitoring of the eight permanent vegetation plots was completed in October 2020. Summary tables and photographs associated with MY6 monitoring are located in Appendix C. MY6 monitoring data indicates that all plots met interim success criteria of 210 planted stems per acre. Planted stem densities among plots ranged from 243 to 688 planted stems per acre with an annual mean of 420 planted stems per acre across all plots. A total of 11 species were documented within the plots. The average tree height observed was 5.9 feet. Some of the wetland area plots (especially Plot 8) are showing below average stem heights for MY6. RES believes this is due to the short growing season and year-round high-water table which is more conducive to mountain bog and fen community.

#### 1.4.2. Stream Geomorphology

Visual assessment of the stream channel was performed to document signs of instability, such as eroding banks, structural instability, or excessive sedimentation. In April 2019 and July 2020, RES treated the vegetation in Parrish Branch with aquatic safe herbicide. The goal was to remove the wetland vegetation that was growing in the channel and causing aggradation. During the October field work and on the cross-section plots (**Appendix D**), it was apparent that the herbicidal treatment of the vegetation in Parrish Branch was effective and will be performed again in 2021. RES also heavily livestaked the banks of the reach in 2020 to further discourage channel vegetation growth. Parrish Branch visual assessments and cross section plots confirm that this reach is no longer a problem area in MY6. Additional photos of Parrish Branch were added to Appendix B.

Geomorphic data for MY6 was collected in October 2020 only on Parrish Branch. Summary tables and cross-section plots related to stream morphology are located in Appendix D. For the Cochran Branch reach, cross-sectional overlays showed minimal dimensional change between MY4 and MY5 data collection efforts. As for the Parrish Branch, between MY5 and MY6, it appears aggradation and channel formation has improved for XS7 and 8 and there was some aggradation on XS9 but a defined channel is still present on the overlay plot (**Appendix B; Table 11a**). RES plans to treat the aquatic vegetation again in MY7 to continue to help move sediment properly through this reach. In MY5, all measurements are based on fixed baseline cross sectional area; therefore, bankfull elevation was adjusted for each cross-section to achieve a cross-sectional area equivalent to the reported baseline cross-sectional area. None of the riffle cross sections exceeded a 1.2 BHR.

Substrate monitoring was performed during MY5. Pebble count d50 was medium gravel for Cochran Branch, and sand for Parrish Branch. The channel substrate will be monitored again in MY7 to document shifts in particle size distributions.

The bank pin arrays indicate that no erosion is taking place in the meanders during MY5 and will be reported again in MY7 (**Appendix D**; **Table 12**).

#### 1.4.3. Groundwater and Stream Hydrology

During MY6, eight of the eight groundwater monitoring wells met the 8 percent hydroperiod success criteria (**Appendix E; Table 16**). All well hydroperiods were 77 percent of the growing season. Due to barometric pressure gauge failure, data for the first 44 days of the growing season were missed.

At least two bankfull events were observed in MY6. The crest gauge on Cochran Branch had a water mark that was 1.92 feet high and Parrish Branch had a water mark that was 1.33 feet high. Photos of the crest gauges are in Appendix E.

#### 2.0 METHODS

This report presents the results of the Monitoring Year 6 (MY6) visual, hydrologic, morphological, and vegetation data. Permanent photo station photos were collected in October 2020. Additional photos of vegetation or stream problem areas were taken as needed.

Geomorphic measurements were taken during low flow conditions using a Topcon GTS-312 Total Station. Three-dimensional coordinates associated with cross-section data was collected in the field and geo-referenced (NAD83 State Plane feet FIPS 3200). Morphological data was collected at 9 cross-sections. Survey data was imported into CAD, ArcGIS®, and Microsoft Excel® for data processing and analysis. Channel substrate was characterized using a Wolman Pebble Count as outlined in Harrelson et al. (1994) and processed using Microsoft Excel.

Vegetation success is being monitored at eight permanent monitoring plots. Vegetation monitoring follows the CVS-EEP Level 2 Protocol for Recording Vegetation, version 4.2 (Lee et al. 2008) and includes analysis of species composition and density of planted species. Data is processed using the CVS data entry tool. In the field, the four corners of each plot were permanently marked with rebar and photos of each plot taken from the origin each monitoring year.

Precipitation data was collected using an Onset HOBO Data Logging Rain Gauge. Groundwater for hydrologic success of restored wetlands was monitored using eight HOBO U20 Water Level Loggers. An additional logger was installed on site, above ground, for use as a barometric reference. Data loggers collected depth to groundwater daily and all data were processed using HOBOware and analyzed using Microsoft Excel. Bankfull events were documented with two crest gauges, one each being located on Cochran Branch and Parrish Branch. During quarterly visits to the site, the height of the corkline was recorded.

# Appendix B Visual Assessment Data

#### Table 5. Visual Stream Morphology Stability Assessment Cochran Stream and Wetland Restoration Project - Cochran Branch Assessed Length 1,418 feet

Major Channel Category	Channel Sub-Category	Metric	Number Stable, Performing as Intended	Total Number in As-built	Number of Unstable Segments	Amount of Unstable Footage	% Stable, Performing as Intended	Number with Stabilizing Woody Vegetation	Footage with Stabilizing Woody Vegetation	Adjusted % for Stabilizing Woody Vegetation
1. Bed	1. Vertical Stability	Aggradation - Bar formation/growth sufficient to significantly deflect flow laterally (not to include point bars).			0	0	100%			
	(Riffle and Run Units)	2. <u>Degradation</u> - Evidence of downcutting.			0	0	100%			
	2. Riffle Condition	1. <u>Texture/Substrate</u> - Riffle maintains coarser substrate.	23	23			100%			
	3. Meander Pool	Depth Sufficient (Max Pool Depth : Mean Bankfull Depth≥ 1.6).	23	23			100%			
	Condition	Length appropriate (>30% of centerline distance between tail of upstream riffle and head of downstream riffle).	23	23			100%			
	4. Thalweg Position	1. Thalweg centering at upstream of meander bend (Run).	23	23			100%			
	4. Thatweg I osition	2. Thalweg centering at downstream of meander bend (Glide).	23	23			100%			
2. Bank	1. Scoured / Eroding	Bank lacking vegetative cover resulting simply from poor growth and/or scour and erosion.			0	0	100%	0	0	100%
	2. Undercut	Banks undercut/overhanging to the extent that mass wasting appears likely. Does NOT include undercuts that are modest, appear sustainable and are providing habitat.			0	0	100%	0	0	100%
	3. Mass Wasting	Bank slumping, calving, or collapse.			0	0	100%	0	0	100%
				Totals	0	0	100%	0	0	100%
3. Engineered Structures	1. Overall Integrity	Structures physically intact with no dislodged boulders or logs.	23	23			100%			
	2. Grade Control	Grade control structures exhibiting maintenance of grade across the sill.	23	23			100%			
	2a. Piping	Structures lacking any substantial flow underneath sills or arms.	23	23			100%			
	3. Bank Protection	Bank erosion within the structures extent of influence does <u>NOT</u> exceed 15%.	23	23			100%			
	4. Habitat	Pool forming structures maintaining~ Max Pool Depth : Mean Bankfull Depth Ratio ≥ 1.6. Rootwads/logs providing some cover at base-flow.	23	23			100%			

#### Table 5 Cont'd. Visual Stream Morphology Stability Assessment Cochran Stream and Wetland Restoration Project - Parrish Branch Assessed Length 402 feet

Major Channel Category	Channel Sub-Category  1. Vertical Stability (Riffle and Run Units)	Metric  1. Aggradation - Bar formation/growth sufficient to significantly deflect flow laterally (not to include point bars).  2. Degradation - Evidence of downcutting.	Number Stable, Performing as Intended	Total Number in As-built	Number of Unstable Segments	Amount of Unstable Footage	% Stable, Performing as Intended	Number with Stabilizing Woody Vegetation	Footage with Stabilizing Woody Vegetation	Adjusted % for Stabilizing Woody Vegetation
	2. Riffle Condition	Texture/Substrate - Riffle maintains coarser substrate.	22	22	,		100%			
	3. Meander Pool Condition	Depth Sufficient (Max Pool Depth : Mean Bankfull Depth≥ 1.6).	22	22			100%			
		Length appropriate (>30% of centerline distance between tail of upstream riffle and head of downstream riffle).	22	22			100%			
	4. Thalweg Position	1. Thalweg centering at upstream of meander bend (Run).	22	22			100%			
		2. Thalweg centering at downstream of meander bend (Glide).	22	22			100%			
2. Bank	1. Scoured / Eroding	Bank lacking vegetative cover resulting simply from poor growth and/or scour and erosion.			0	0	100%	0	0	100%

DESCRIPTI	ON OF WORKSHEETS IN THIS DOCUMENT
	Description of database file, the report worksheets, and a summary
Metadata	of project(s) and project data.
	Each project is listed with its PLANTED stems per acre, for each
Proj, planted	year. This excludes live stakes.
	Each project is listed with its TOTAL stems per acre, for each year.
	This includes live stakes, all planted stems, and all
Proj, total stems	natural/volunteer stems.
	List of plots surveyed with location and summary data (live stems,
Plots	dead stems, missing, etc.).
Vigor	Frequency distribution of vigor classes for stems for all plots.
Vigor by Spp	Frequency distribution of vigor classes listed by species.
	List of most frequent damage classes with number of occurrences
Damage	and percent of total stems impacted by each.
Damage by Spp	Damage values tallied by type for each species.
Damage by Plot	Damage values tallied by type for each plot.
Planted Stems by Plot and	A matrix of the count of PLANTED living stems of each species for
Spp	each plot; dead and missing stems are excluded.
	A matrix of the count of total living stems of each species (planted
	and natural volunteers combined) for each plot; dead and missing
ALL Stems by Plot and spp	stems are excluded.

### Appendix E MY4 IRT Credit Release Site Visit Memo

#### MEMORANDUM

302 Jefferson Street, Suite 110

Raleigh, North Carolina 27605

919.209.1052 tel.

919.829.9913 fax

**TO:** Paul Wiesner - DMS

FROM: Ryan Medric - RES

**DATE:** 06/17/2019

RE: Cochran Branch MY4 IRT Credit Release Site Visit

#### **Attendees:**

IRT: Todd Tugwell (USACE), Mac Haupt (NCDWR), Erin Davis (NCDWR), David Brown (USACE)

DMS: Paul Wiesner (DMS), Melonie Allen (DMS)

RES: Brad Breslow (RES), Brian Hockett (RES), Aaron Speaks (RES), Ryan Medric (RES)

Date: June 5, 2019

The IRT, DMS, and RES had a site visit at the Cochran Branch Stream Restoration Site to discuss the Monitoring Year 4 (MY4) credit release. The main topic of discussion was the sedimentation and lack of channel defining features on Parrish Branch observed in monitoring reports by RES and DMS. During the site visit, the majority of Parrish Branch had substantial flow contained in a single channel. One section located near cross sections seven and eight, however, had characteristics more like a braided system with water flowing in multiple locations. David Brown (USACE) commented that channelized stream flow was typical of this type of channel during the winter months and dormant season. He suggested the IRT revisit the site in November/December 2020 to get a more representative view of the reach. Also, it was noted during the visit that there was gravel/cobble bed substrate in the channel, but it was buried by a few inches of fine silt/sand.

In April 2019, RES treated the channel vegetation with an aquatic safe herbicide. The IRT was ok with this treatment but was adamant that they did not want to see any digging or raking in the channel. Additionally, Erin Davis (NCDWR) noted multiflora rose scattered in the easement and RES agreed to continue treating the invasive species throughout the site for the remainder of the monitoring period.

The IRT generally agreed that the on-site wetlands and project streams (aside from Parrish Branch) were meeting the established success criteria. They agreed to release MY4 project credits per the credit release schedule established in the approved mitigation plan. The IRT requested that project stream credits released on the site not exceed the stream credits associated with Parrish Branch (396 SMUs). There will be a total of 445.75 unreleased stream credits on the site after the IRT MY4 (2018) credit release approval.
