1.0 SUMMARY

This Annual Report details the monitoring activities during the 2008 growing season on the Cox Mitigation Site. Construction of the site was completed in December 2005. The 2008 data represent the results from the third year of hydrologic, vegetation, and stream morphology monitoring.

Restoration of the Cox site involved stream restoration, stream enhancement, riverine wetland restoration, and non-riverine wetland restoration. Construction included a stable meandering channel across prior-converted hydric agricultural fields. The channel was designed and constructed with natural channel design techniques. Wetland restoration activities included raising the water table by filling drainage ditches and creation of microtopography across the site. After construction it was determined there was 7,292 linear feet of stream restoration, 350 linear feet of stream enhancement, 26.8 acres of riverine wetland restoration, and 16.9 acres of non-riverine wetland restoration. **Appendix A** contains the As-Built survey.

This Annual Report presents data from the 12 hydrology monitoring gauges, 22 vegetation monitoring plots, a crest gauge, an on-site rain gauge, and 16 cross sections as required by the approved Restoration Plan.

In 2008 eleven of the twelve hydrology monitoring gauges recorded hydroperiods of at least 7 percent of the growing season. The gauge that did not record a success criteria hydroperiod did record a hydroperiods of 4 percent of the growing season, which correlates with data recorded by gauges located in the reference wetland. Based on the monitoring results of Years 1 through 3, it is concluded that the restored wetland is performing as designed.

Weather station data from the Smithfield Weather Station were used in conjunction with a manual rain gauge located on the site to document precipitation amounts. The manual gauge is used to validate observations made at the automated station.

This Annual Report documents vegetation survivability based on twenty-two vegetation-monitoring plots randomly located to represent the different zones within the project. The vegetation monitoring for 2008 documented a range of surviving tree stem density of 440 stems per acre to 800 stems per acre, with an average tree density of 640 stems per acre. Overall, the site has met the initial vegetation success criteria of 320 stems per acre surviving after the third growing season as specified in the Restoration Plan.

During 2008 the restored stream channel remained stable and continued to provide the intended habitat and hydrologic functions. Two bankfull events were recorded during the year. All monitored cross sections show very little adjustment in stream dimension, and it was concluded that the site remains on track to achieve the stream success criteria as specified in the Restoration Plan for the site.

2.0 INTRODUCTION

2.1 PROJECT DESCRIPTION

The Cox wetland and stream restoration site is located near the community of Bentonville in Johnston County, North Carolina (**Figure 1** and **Figure 2**). The site has a past history of agricultural use consisting primarily of row crop agriculture. Ditches on the site were used to increase subsurface drainage when the land was under agricultural production. Construction of the site, including planting of trees, was completed in December 2005. water, and rain gauges were functional beginning January 2006. The 2008 monitoring season represents the third year of monitoring for the site.

2.2 PROJECT PURPOSE

Monitoring of the Cox site is required to demonstrate successful restoration based on the criteria found in the Restoration Plan, and through a comparison to reference site conditions. hydrology, vegetation, and stream monitoring are conducted on an annual basis. Success criteria must be met for five consecutive years. This Annual Report details the results of the monitoring efforts for 2008 (Year 3) at the Cox Mitigation Site.

3.0 HYDROLOGY

3.1 HYDROLOGIC SUCCESS CRITERIA

As stated in the approved Mitigation Plan, to meet the hydrologic success criteria the monitoring data must show that for each normal year of rainfall within the monitoring period, the site has been inundated or saturated within 12 inches of the soil surface for a minimum of seven percent of the growing season (17 days). The day counts are based on the growing season for Johnston

County, which is 232 days long (17 March – 5 November). As specified in the approved Restoration Plan, data are collected from nine automated and three manual groundwater gauges. The Restoration Plan further specified that in order for the hydrologic data to be considered successful it must be demonstrated that precipitation is either within or below normal limits.

3.2 DESCRIPTION OF HYDROLOGY MONITORING EFFORTS

Three manual groundwater gauges, nine automated Infinities groundwater gauges, a manual rain gauge, and one manual stream crest gauge were in-place throughout the 2008 growing season (**Figures 3a and 3b**). The monitoring protocol for the site specifies that automated monitoring stations will be downloaded and checked for malfunctions on a monthly basis. During monthly site visits, manual groundwater gauges are read, the crest gauge is read, and rainfall totals are collected from the on-site rain gauge.

Automated Gauges

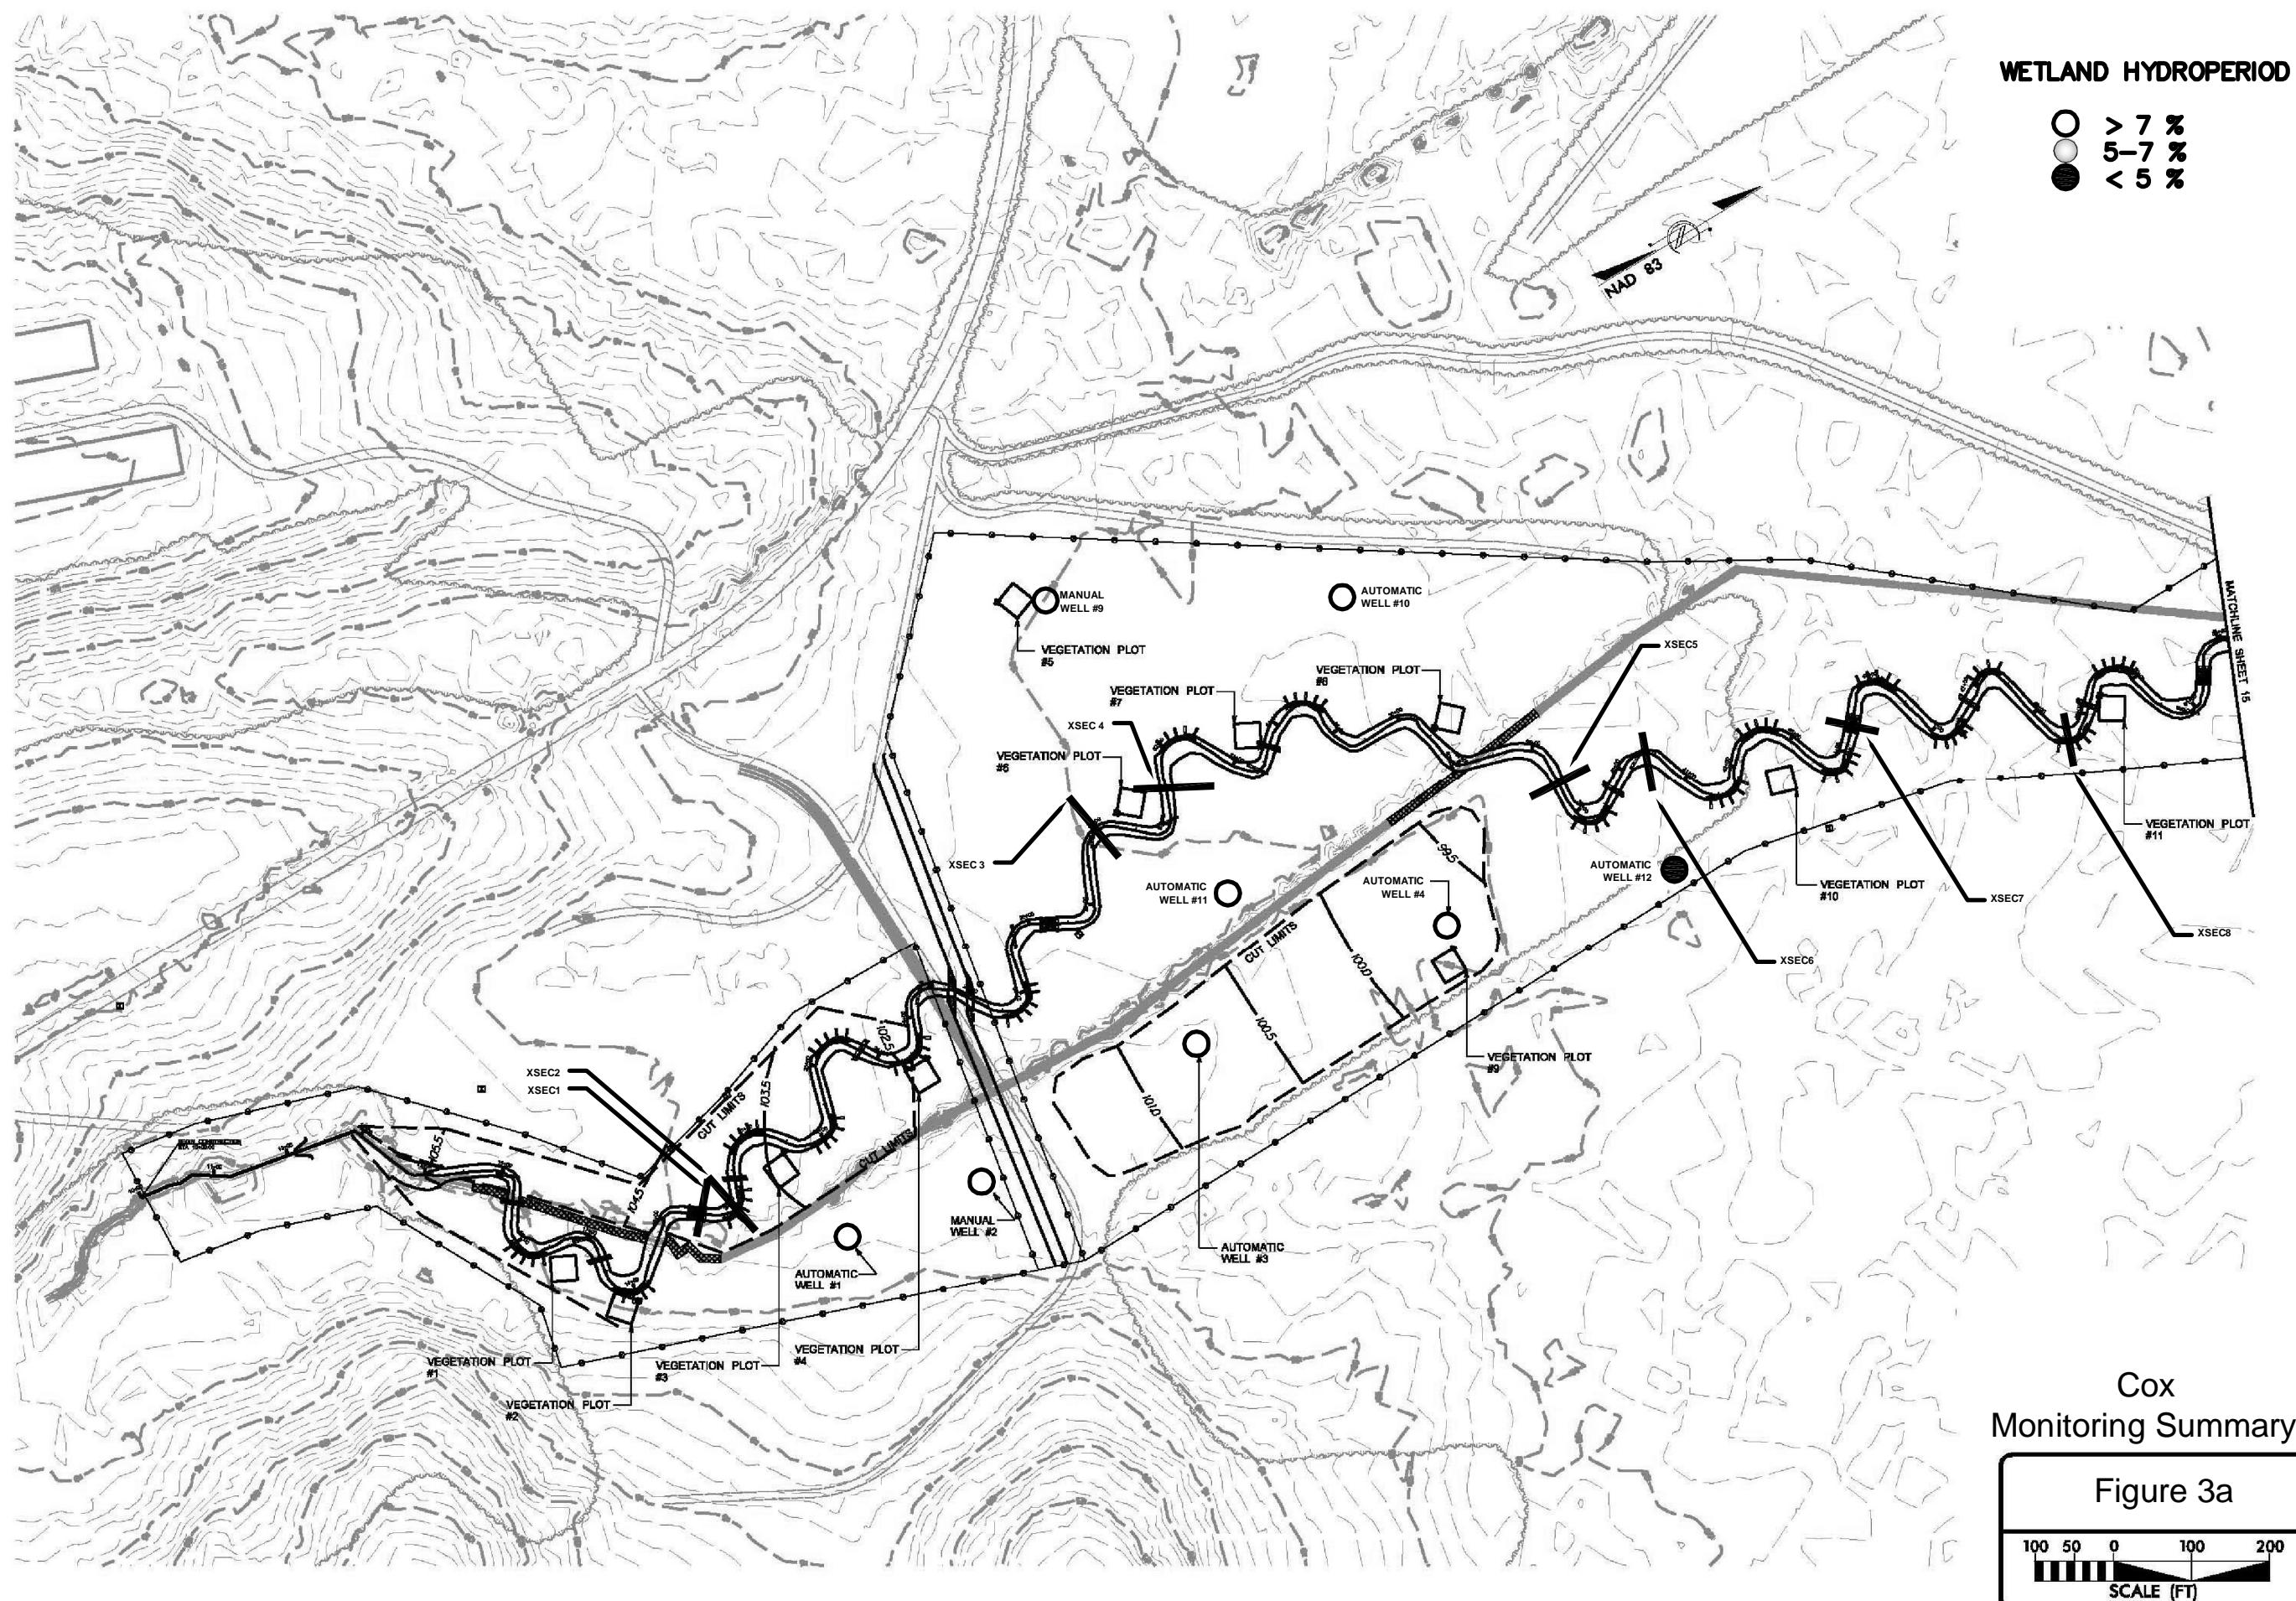

Automatic groundwater gauges record water table elevations twice daily at 08:00 and 20:00. Infinities gauges employ pressure sensors that record water elevation above the bottom of the sensor (with atmospheric pressure compensation). Immediately adjacent to each automatic gauge is a manual calibration gauge. The calibration water table depth is recorded at monthly downloads. To determine wetland hydroperiods, the automatically recorded data are compared to the calibration data to determine a standard correction factor between the calibration gauge and the automatic gauge for each location. The standard correction factor is applied to correct daily readings. The corrected daily readings are then used to determine wetland hydroperiods.

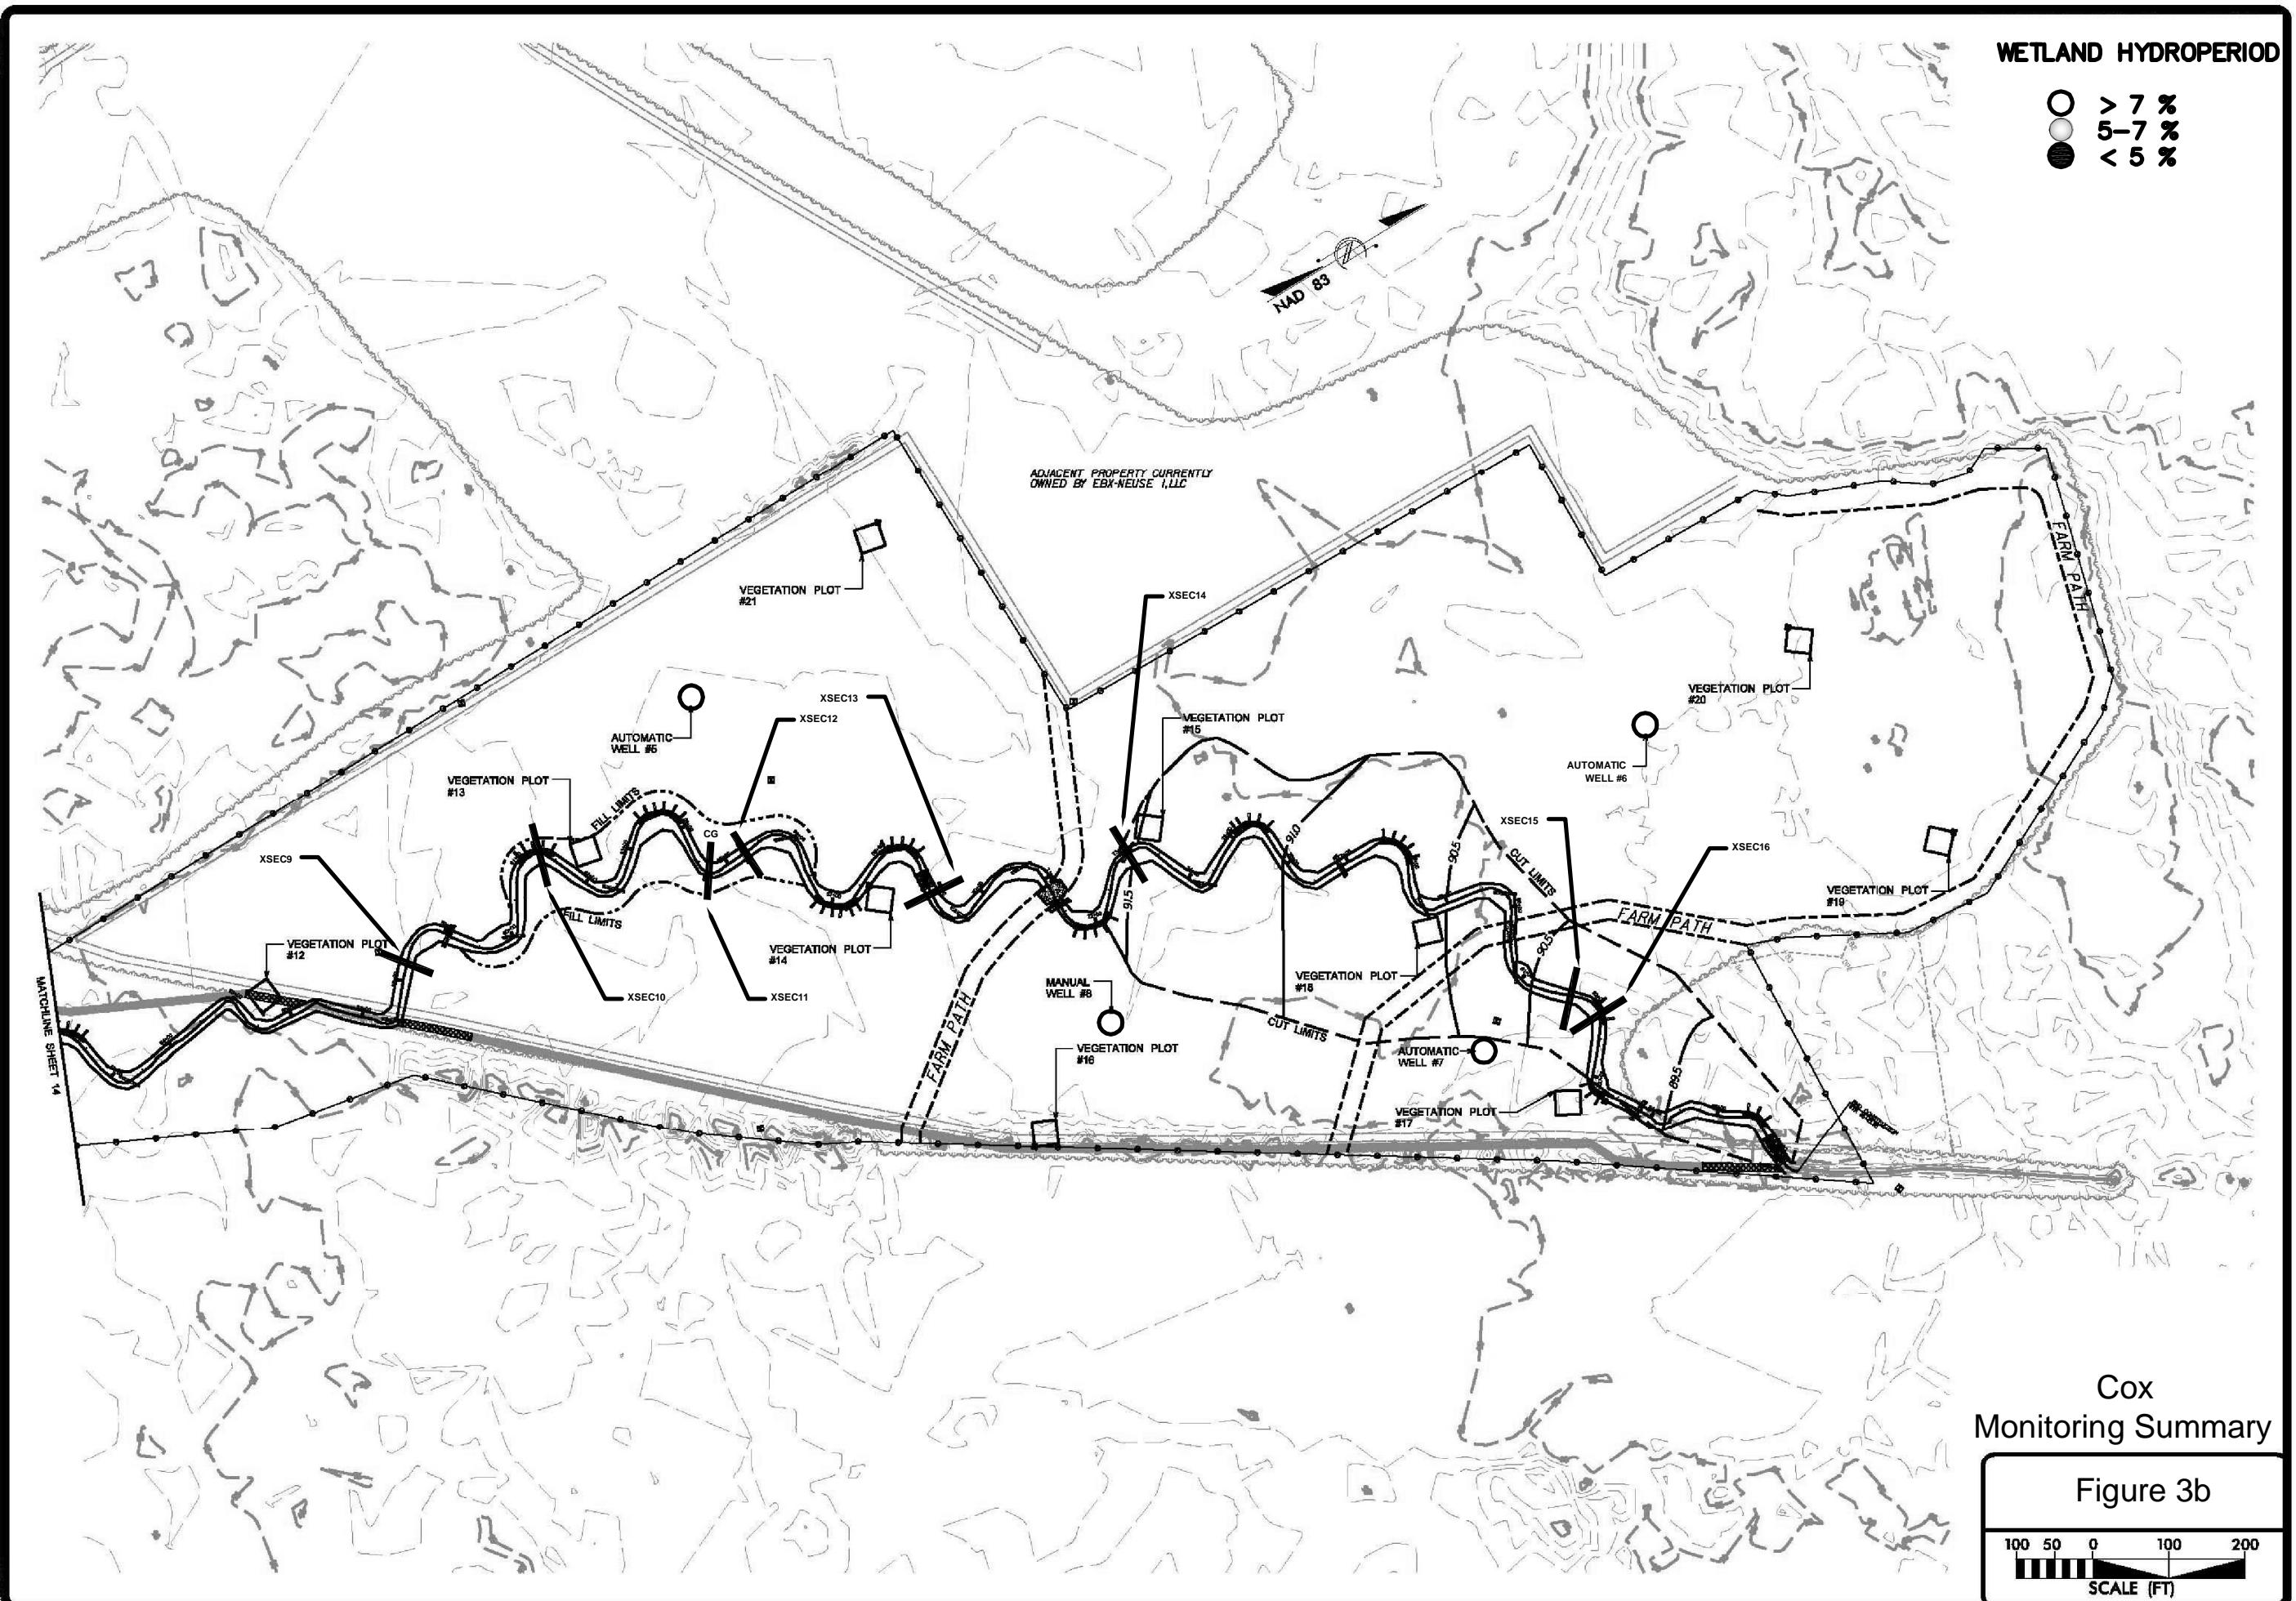

Manual Gauges

Water table depths are recorded monthly in manual groundwater gauges. To calculate wetland hydroperiods, interpolations are made between monthly readings by correlating twice daily automatic gauge readings. Each manual gauge is correlated to an automatic gauge based on proximity, landscape position, and the relationship of their groundwater depth readings (i.e. if their readings are separated by a consistent value). Once the appropriate automatic gauge has been selected a correction factor is calculated for each monthly gauge reading. This correction factor typically varies by several inches on a monthly basis. A daily rate of change between monthly correction factors is calculated to determine the daily correction factor. The daily correction factor is then applied to the automatic gauge readings to calculate an estimated daily water table depth for the manual gauge. These daily readings are used to determine wetland hydroperiods.

Data Interpretation

Wetland hydroperiods are calculated from twice daily water table depth elevations. A hydroperiod is calculated if the water table is equal to or less than -12 inches below ground surface for at least 24 hours. If a gauge falls below -12 inches for two consecutive readings (24 hours), then the hydroperiod ends at the last reading within -12 inches. If a gauge falls below -12 inches for only one reading then maintains a reading above -12 inches for a minimum of 24 hours, the hydroperiod is calculated continuously. This methodology accounts for minor technical malfunctions experienced by the automatic gauges.

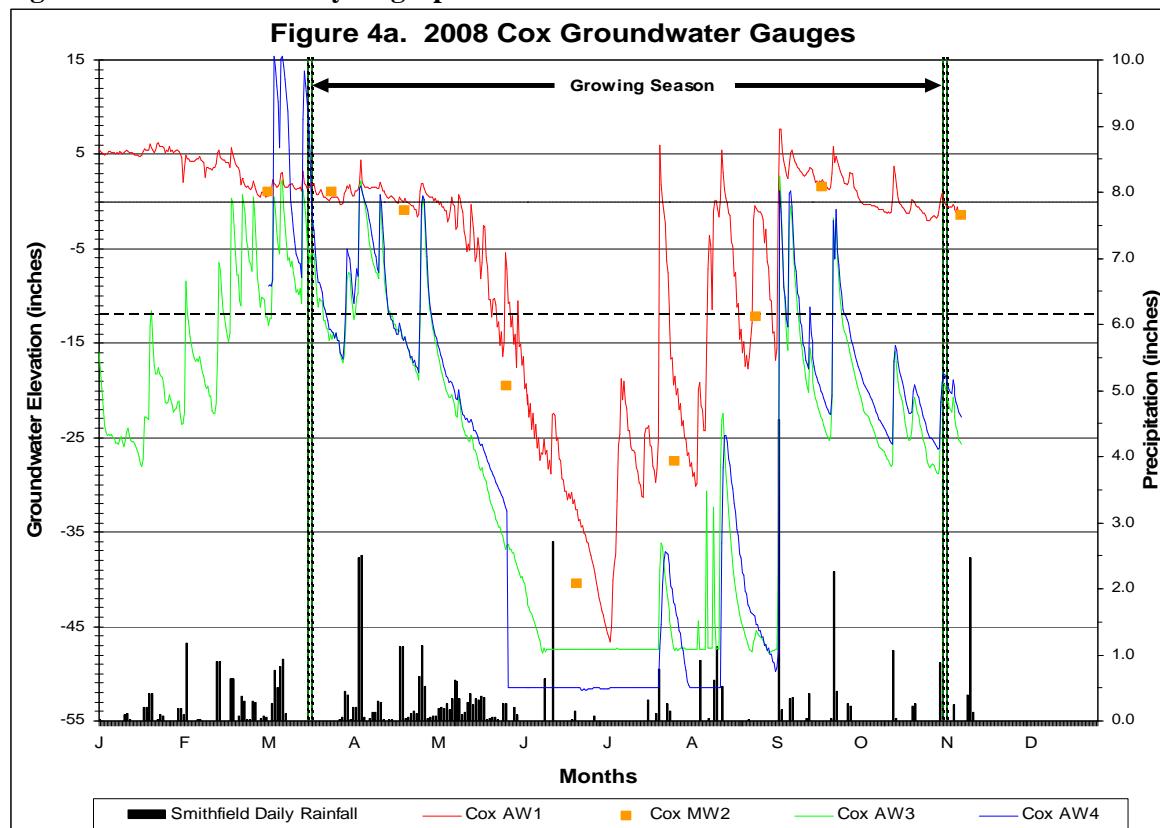

3.3 RESULTS OF HYDROLOGY MONITORING

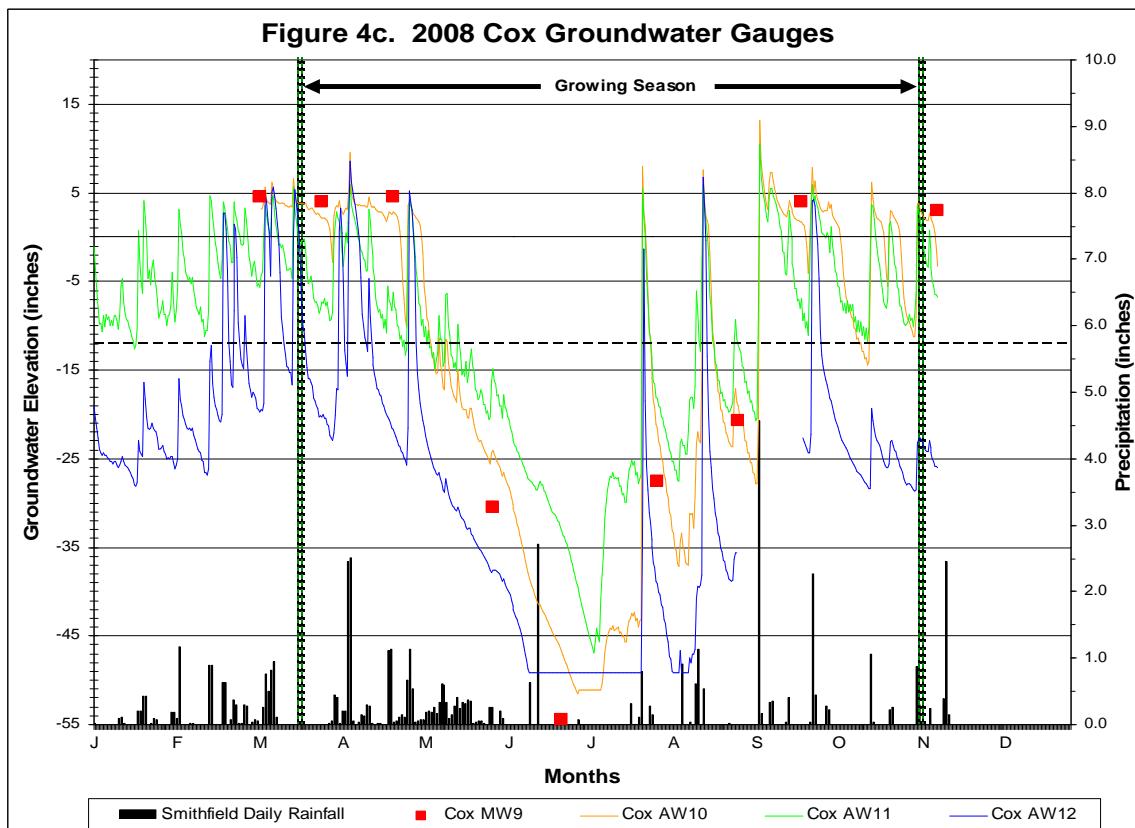

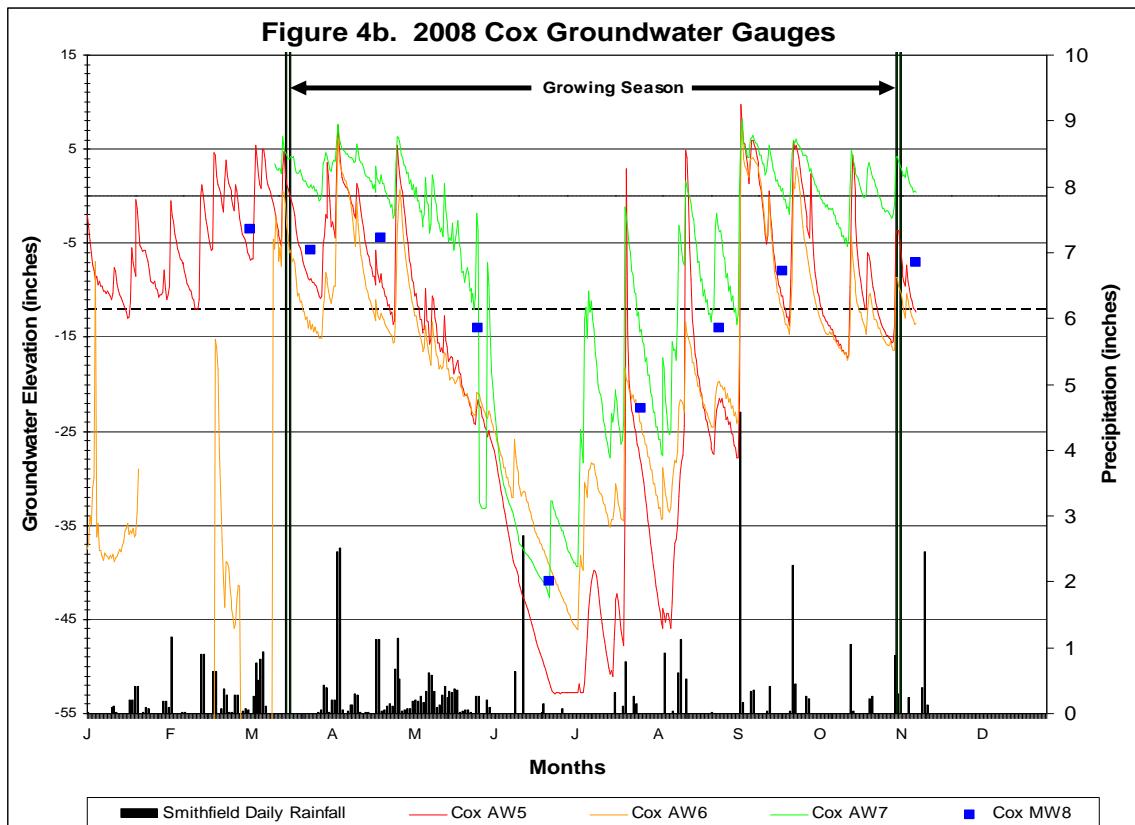

3.3.1 Site Data

The following hydroperiod statistics were calculated for each monitoring station during the growing season: 1) most consecutive days that the water table was within twelve inches of the soil surface; 2) cumulative number of days that the water table was within twelve inches of the soil surface; and 3) number of times that the water table rose to within twelve inches of the soil surface. The results of these calculations are presented in **Table 4**. **Figures 4a, 4b, and 4c** provide charts of the water depth for each of the monitoring gauges on the site. Precipitation is shown in **Figure 5**. Raw hydrograph data collected from the monitoring gauges are provided in **Appendix C**.

Year Three monitoring demonstrates that the site is functioning as designed, with varying degrees of wetness and saturation across the site. Gauges AW1, MW2, AW3, AW4, AW5, AW6, AW7, MW8, MW9, AW10, and AW11 exceeded the 7 percent hydrologic success criteria with several of those recording a wetland hydroperiod of 16 percent or more. Gauge AW12 had a significant hydroperiod of 4 percent of the growing season and outperformed two of the five reference gauges. Gauge AW12 achieved a 7 percent hydroperiod at a depth of 17 inches below the surface. Overall, the mitigation site recorded a range of hydroperiods very similar to the range of hydroperiods recorded at the reference wetland site.

3.3.2 Reference Data

The approved Restoration Plan for the site provides that if the rainfall data for any given year during the monitoring period is not normal, the reference wetland data can be used to determine if there is a positive correlation between the performance of the restoration site and the natural hydrology of the reference site.

The same hydroperiod statistics were calculated for each reference monitoring station during the growing season as were calculated for the site monitoring stations. The results of these calculations are presented in **Figure 4** and **Table 4**. The reference gauges exhibit a range of hydroperiods similar to the mitigation site data, including two gauge locations (Ref AW1 and MW5) with a minimal wetland hydroperiod. The reference gauges are located in a riverine wetland upstream of the adjacent Westbrook mitigation site.

3.3.3 Climate Data

The Cox mitigation site experienced on-site rainfall conditions that were just slightly below the annual average for Smithfield. Although several months this year experienced below average rainfall amounts, as of September the Smithfield weather station has received above-normal rainfall totals (1.09 inches) for the year. Overall, the Cox mitigation site has shown vast improvement and recovery from last year's severe drought conditions.

Figure 5. 2008 Rainfall

3.4 HYDROLOGIC CONCLUSIONS

Data collected from all the groundwater monitoring gauges on the Cox Mitigation Site indicate that eleven of twelve hydrology monitoring stations recorded hydroperiods of at least 7 percent of the growing season. The remaining gauge recorded a hydroperiod of 4 percent of the growing season which mirrored conditions experienced in the reference wetland. The minimum depth at which this gauge would have reached the 7 percent success criteria is -18".

On-site rainfall data was slightly below the normal average during the 2008 growing season. Based on the results from the mitigation site monitoring gauges during Years 1 through 3, it was concluded that the site is performing as designed.

4.0 VEGETATION

4.1 VEGETATION SUCCESS CRITERIA

The interim measure of vegetative success for the Cox Wetland Mitigation Plan will be the survival of at least 320 3-year old planted trees per acre at the end of Year 3 of the monitoring period. The final vegetative success criteria will be the survival of 260 5-year old planted trees per acre at the end of Year 5 of the monitoring period.

Up to 20 percent of the site species composition may be comprised of invaders. Remedial action may be required should these (i.e. loblolly pine, red maple, sweet gum, etc.) present a problem and exceed 20 percent composition.

4.2 DESCRIPTION OF SPECIES AND VEGETATION MONITORING

The following monitoring protocol was designed to monitor vegetation survival: 22 plots were established on the Cox Wetland Mitigation Site to monitor approximately 1.2 percent of the site. Fifteen of the plots are established next to the streambed to monitor the vegetation in the stream restoration buffer and riverine wetland zone. The other seven plots are randomly located to represent the non-riverine wetland zone on the site.

Plots have metal fence posts at each of the four corners to clearly and permanently establish the area to be sampled. Then ropes are hung connecting all four corners to help in determining if trees close to the plot boundary are inside or outside of the plot. Trees right on the boundary and trees just outside of the boundary that appear to have greater than 50 percent of their canopy inside the boundary are counted inside the plot. A piece of white PVC pipe ten feet tall is placed over the metal post on one corner to facilitate visual location of site throughout the five-year monitoring period.

All of the planted stems inside the plot are flagged with orange flagging and marked with a 3-foot tall piece of half inch PVC to mark them as the planted stems (vs. any colonizers) and to help locate them in the future. Each stem is tagged with a permanent numbered aluminum tag.

Table 6. Planted Tree Species

8	<i>Nyssa biflora</i>	Swamp Tupelo	OBL
9	<i>Taxodium distichum</i>	Bald Cypress	OBL
10	<i>Fraxinus pennsylvanica</i>	Green Ash	FACW

The vegetation monitoring documented a surviving tree stem density range of 440 to 800 stems per acre with an overall average density of 640 stems per acre. Overall, the site has met the initial vegetation survival criteria of 320 stems per acre surviving after the third growing season and is on track for meeting the final vegetation survival criteria of 260 stems per acre surviving after the fifth growing season.

4.3 RESULTS OF VEGETATION MONITORING

Table 7 presents stem counts for each of the monitoring plots. Each planted tree species is identified across the top row, and each plot is identified down the left column. The numbers on the top row correlate to the ID column of the previous table. Trees are flagged in the field on an as need basis before the flags degrade. Flags are utilized, because they will not interfere with the growth of the tree. Volunteers are also flagged and recorded during this process (**Table 8**).

*Cox Mitigation Site
Annual Monitoring Report for 2008 (Year 3)*

Annual variation in stem count data can be attributed to mortality and regeneration from root stock of stems previously assessed to be dead.

Volunteer species are also monitored throughout the five-year monitoring period. Below is a table of the most commonly found woody volunteer species.

ID	Scientific Name	Common Name	FAC Status
A	<i>Liquidambar styraciflua</i>	Sweetgum	FAC+
B	<i>Acer rubrum</i>	Red Maple	FAC
C	<i>Pinus taeda</i>	Loblolly Pine	FAC

Volunteer woody species were observed in very high quantities in vegetation Plots 10 and 11. Management efforts should be focused on controlling the invasives in and around these plots.

Sweetgum (*Liquidambar styraciflua*) is the most common volunteer, though red maple (*Acer rubrum*) and loblolly pine (*Pinus taeda*) were also observed.

4.4 VEGETATION OBSERVATIONS & CONCLUSIONS

After construction of the mitigation site, a permanent ground cover seed mixture of Virginia wild rye (*Elymus virginicus*), switch grass (*Panicum virgatum*), and fox sedge (*Carex vulpinoidea*) was broadcast on the site at a rate of 10 pounds per acre. Hydrophytic herbaceous vegetation, including rush (*Juncus effusus*), spike-rush (*Eleocharis obtusa*), boxseed (*Ludwigia* sp.), sedge (*Carex* spp.), smartweed (*Polygonum* spp.), and woolgrass (*Scirpus cyperinus*) were observed across the site, particularly in areas of periodic inundation. The presence of these herbaceous wetland plants helps to confirm the presence of wetland hydrology on the site.

There are quite a few weedy species occurring on the site, though none seem to be posing any problems for the woody or herbaceous hydrophytic vegetation. Commonly seen weedy vegetation includes ragweed (*Ambrosia artemisiifolia*), wild dill (*Foeniculum vulgare*), goldenrod (*Solidago* spp.), dogfennel (*Eupatorium capillifolium*), horseweed (*Conyza* spp.), and broomsedge (*Andropogon* spp.). Any threatening weedy vegetation found in the future will be documented and discussed in annual reports.

The site was planted in costal plain small stream swamp and wet hardwood forest species in January 2006. There were twenty-two vegetation-monitoring plots established throughout the planting areas. The data reflects that the site has met the minimum success interim criteria of 320 trees per acre at the end of year three and is on trajectory to meet the final success criteria of 260 trees per acre at the end of year five.

5.0 STREAM MONITORING

5.1 STREAM SUCCESS CRITERIA

As stated in the approved Restoration Plan, the stream restoration success criteria for the site includes the following:

- *Bankfull Events*: Two bankfull flow events must be documented within the five-year monitoring period.
- *Cross-sections*: There should be little change in as-built cross sections. Cross sections shall be classified using the Rosgen stream classification method, and all monitored cross sections should fall within the quantitative parameters defined for "E" or "C" type channels.
- *Longitudinal Profiles*: The longitudinal profiles should show that the bedform features are remaining stable, e.g. they are not aggrading or degrading. Bedforms observed should be consistent with those observed in "E" and "C" type channels.
- *Photo Reference Stations*: Photographs will be used to subjectively evaluate channel aggradation or degradation, bank erosion, success of riparian vegetation, and effectiveness of erosion control measures.

5.2 STREAM MORPHOLOGY MONITORING PLAN

To document the stated success criteria, the following monitoring program was instituted following construction completion on the Cox Site:

5.2.1 Cross Sections

Two permanent cross sections were installed per 1,000 linear feet of stream restoration work, with one of the locations being a riffle cross-section and one location being a pool cross section. A total of 16 permanent cross sections were established across the mitigation site. Each cross section was marked on both banks with permanent pins to establish the exact transect used. Permanent cross section pins were surveyed and located relative to a common benchmark to facilitate easy comparison of year-to-year data. The annual cross section surveys include points measured at all breaks in slope, including top of bank, bankfull, inner berm, edge of water, and thalweg. Riffle cross-sections are classified using the Rosgen stream classification system. Permanent cross sections for 2008 (Year 3) were surveyed in September 2007.

5.2.2 Longitudinal Profile

A longitudinal profile of approximately 3,000 feet was surveyed along the restoration reach in Years 1 and 3. Measurements include thalweg, water surface, bankfull, and top of low bank. Each of these measurements is taken at the head of each feature, e.g. riffle, run, pool, glide, and the max pool depth. A common benchmark will be used each year to facilitate comparison of year-to-year data.

5.2.3 Hydrology

A crest gauge was installed on the site to document bankfull events (**Figure 3**). The gauge is checked monthly, and records the highest out-of-bank flow event that occurred during the past month (**Table 10**).

5.2.4 Photo Reference Stations

Photographs are used to visually document restoration success. Reference stations are marked with wooden stakes and Global Positioning Satellite (GPS) coordinates have been determined for each location. Reference photos are taken at each permanent cross-section from both stream banks, as well as facing upstream and downstream in the channel. The survey tape is centered in the photographs of the bank, and the water line is located in the lower edge of the frame with as much of the bank as possible included in each photo. In-stream structures (e.g., rock vanes, cross vanes, and constructed riffles) are also photographed. Photo reference stations will be photographed at least once per year for at least 5 years following construction.

5.3 STREAM MORPHOLOGY MONITORING RESULTS

Photographs were taken throughout the monitoring season to document the evolution of the restored stream channel (**Appendix D**). Herbaceous vegetation is moderately dense along the restored stream. Pools have maintained a variety of depths and habitat qualities, depending on the location and type of scour features (logs, root wads, transplants, etc.).

In-stream structures installed within the restored stream included constructed riffles, log vanes, log weirs, and root wads. Visual observations of structures throughout the 2008 growing season indicated several areas requiring continued observation. The log weirs have experienced significant end cutting and undercutting that has resulted in head cuts migrating up the channel. Portions of the stream channel are showing bank erosion and sparse bank vegetation. **Table 9** details the stream areas of concern.

5.3.1 Cross Sections

Year 3 cross section monitoring data for stream stability were collected during September 2008 and compared to baseline data collected in 2006 (**Appendix B**). All monitored cross sections fell within the quantitative parameters defined for "E" or "C" type channels. The cross section data are summarized in **Table 11**.

5.3.2 Longitudinal Profile

A longitudinal profile survey was conducted in Year 3. Based on a comparison to the previous profiles and cross sections, there has been very little adjustment to the stream profile or dimension since construction. Areas requiring further observation are listed in **Table 9**, and their locations are shown in **Figure 6**.

5.3.3 Hydrology

Two bankfull events were recorded during the 2008 monitoring season. They were both late in the growing season. Out of bank events of 1.2 and 1.5 feet above bankfull stage were recorded during the August and September site visits.

5.5 STREAM CONCLUSIONS

Overall the Cox stream mitigation is performing as designed. Cross section and profile data indicates that little change has occurred since the stream was built. Two bankfull events occurred at the site in 2008. Several log weirs have experienced significant end cutting and undercutting, and bank erosion has occurred along portions of the stream. It was concluded that the site is on track to achieve the success criteria specified in the Restoration Plan for the site.

6.0 CONCLUSIONS AND RECOMMENDATIONS

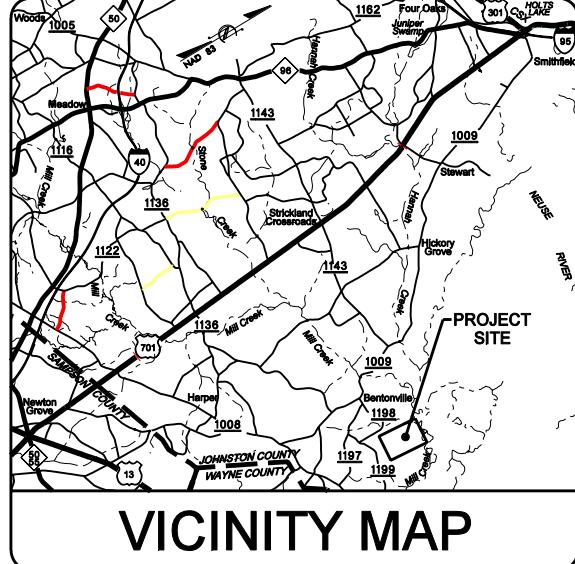

- Year Three hydrologic monitoring demonstrates that the site is on track to achieve the wetland hydrology criteria specified in the Restoration Plan for. In 2008, eleven of the twelve gauges exceeded the 7 percent hydrologic success criteria with several of those recording a wetland hydroperiod of 16 percent or more. The remaining gauge had a significant hydroperiod of 4 percent of the growing season and outperformed two of the five reference gauges. Overall, the mitigation site recorded a range of hydroperiods very similar to the range of hydroperiods recorded at the reference wetland site.
- Vegetation monitoring has documented the average number of stems per acre on site to be 640, which is a survival rate of greater than 90 percent based on the initial planting count of 710 stems per acre. Vegetation survival should remain acceptable across the site. The biggest concern is the amount of undesirable volunteers in Plots 10 and 11. These areas are overpopulated due to the seed trees in close proximity as this is the narrowest point of the site. The site has met the interim success criteria of 320 trees per acre at the end of year three and is on track to meet the final success criteria of 260 trees per acre at the end of year five.
- The restored stream channel has remained stable and is providing the intended habitat and hydrologic functions. Two bankfull events were recorded at the site in 2008. All monitoring cross sections showed very little adjustment in stream dimension. Areas requiring observation include several log weirs that have experienced significant end cutting and undercutting, several areas of bank erosion. The site is on track to achieve the stream success criteria specified in the Restoration Plan for the site.
- Vegetation, hydrologic and stream monitoring will continue through 2010.

GENERAL NOTES

1. THE CONTRACTOR IS REQUIRED TO INSTALL INSTREAM STRUCTURES USING A TRACK HOE WITH A HYDRAULIC THUMB OF SUFFICIENT SIZE TO MOVE BOULDERS 2FT X 2FT X 3FT (APPROXIMATELY 0.7 TONS).

2. THE CONTRACTOR WILL BE REQUIRED TO PROVIDE, AT A MINIMUM, TWO OPERATORS AT ALL TIMES DURING CONSTRUCTION OF THE NEW STREAM CHANNEL. IN GENERAL, ONE OPERATOR WILL CUT THE NEW CHANNEL WITH A TRACK HOE, WHILE THE OTHER OPERATOR FOLLOWS AND INSTALS INSTREAM STRUCTURES, BANK STABILIZATION PRACTICES, AND TRANSPLANTS. DURING CONSTRUCTION OF THE NEW STREAM CHANNEL, THE CONTRACTOR WILL BE REQUIRED TO HAVE TWO TRACK HOES AND ONE LOADER ON-SITE.

3. CONSTRUCTION IS SCHEDULED TO BEGIN JUNE 2005.

TYPICAL STRUCTURE PLACEMENT

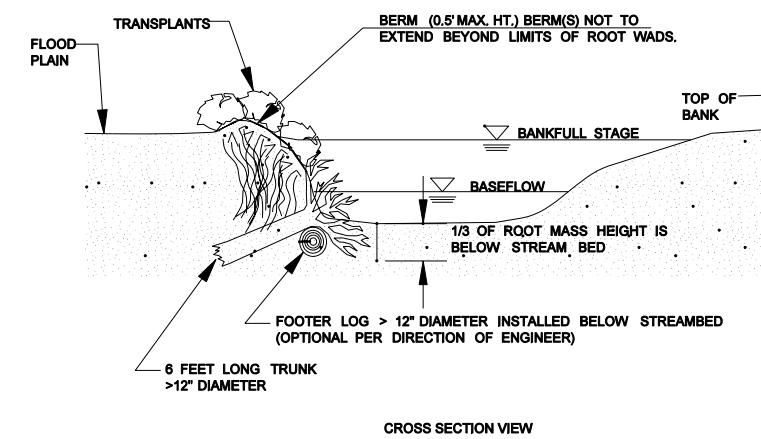

ROOT WADS WITHOUT TRANSPLANTS

NTS

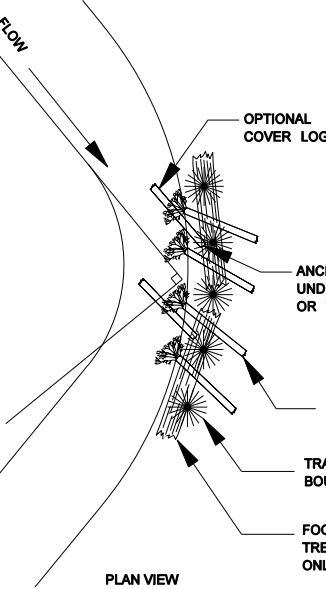

ROOT WADS WITH TRANSPLANTS

NTS

ROOT WADS

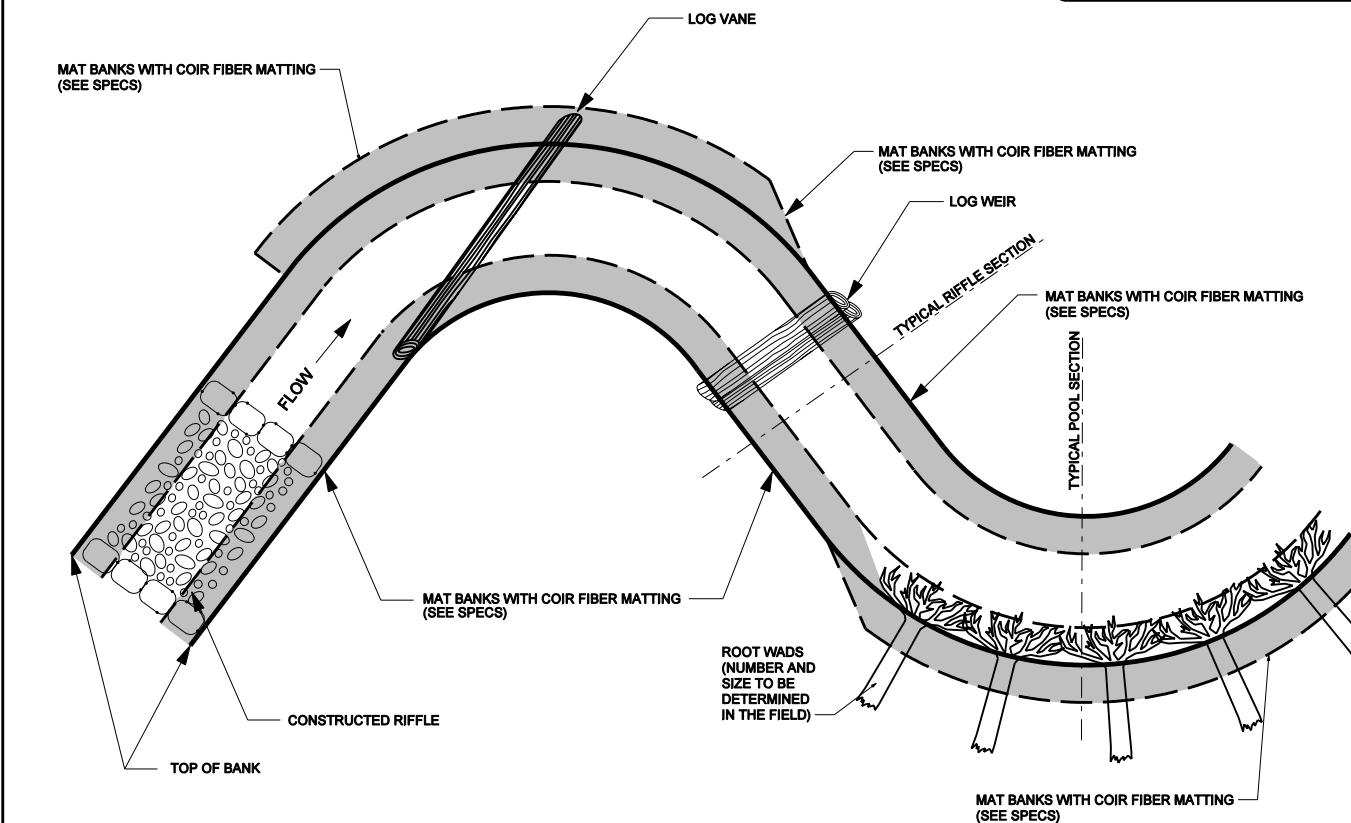

NOTES:
TRENCHING METHOD:
IF THE ROOT WAD CANNOT BE DRIVEN INTO THE BANK OR THE BANK NEEDS TO BE RECONSTRUCTED, THE TRENCHING METHOD SHOULD BE USED. THIS METHOD REQUIRES THAT A TRENCH BE EXCAVATED ALONG THE PORTION OF THE PROJECT. IN THIS CASE, A FOOTER LOG SHOULD BE INSTALLED UNDERNEATH THE ROOT WAD IN A TRENCH EXCAVATED PARALLEL TO THE BANK AND WELL BELOW THE STREAMBED. ONE-THIRD OF THE ROOT WAD SHOULD REMAIN BELOW NORMAL BASE FLOW CONDITIONS.

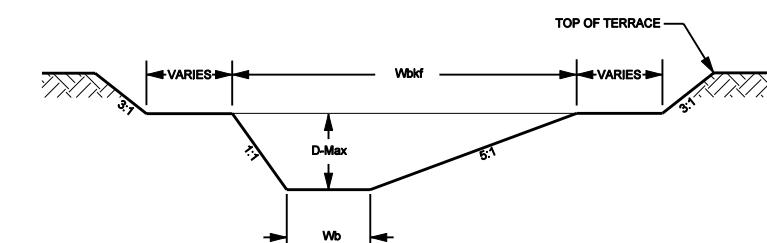

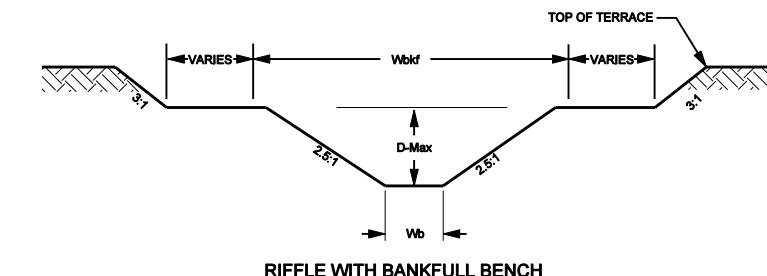

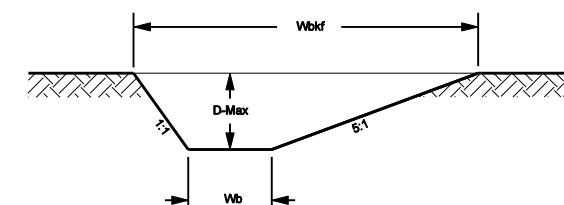

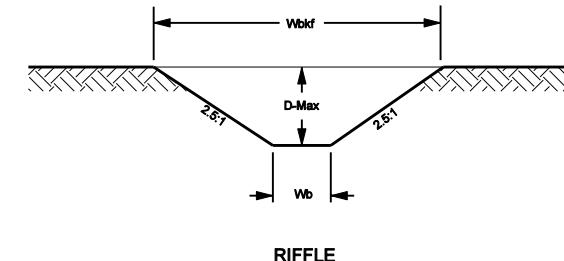

NOTES:
DRIVE POINT METHOD:
SHARPEN THE END OF THE LOG WITH A CHAINSAW BEFORE "DRIVING" IT INTO THE BANK. ORIENT ROOT WADS UPSTREAM SO THAT THE STREAM FLOW MEETS THE ROOT WAD AT A 90-DEGREE ANGLE. DEFLECT THE WATER AWAY FROM THE BANK. A TRANSPLANT OR BOULDER SHOULD BE PLACED ON THE DOWNSTREAM SIDE OF THE ROOT WAD IF A BACK EDGE IS FORMED BY THE ROOT WAD. THE BOULDER SHALL BE APPROXIMATELY 4' X 3' X 2'.

STRUCTURE NOTES:
1. GENERALLY LOG WEIRS, ROOT WADS, LOG VANES AND COIR FIBER MATTING WILL BE INSTALLED IN THE LOCATION AND SEQUENCE AS SHOWN.
2. ADDITIONAL STRUCTURES OR CHANGES TO STRUCTURE LOCATIONS MAY BE MADE BY THE DESIGN ENGINEER DURING CONSTRUCTION.

NOTES:
1. COIR FIBER MATTING TO BE INSTALLED ON ALL RESTORED STREAMBEDS.
2. IF ROOT WADS DO NOT COVER ENTIRE SLOPE ON OUTSIDE OF MEANDER BENDS, COIR FIBER MATTING IS NEEDED.

NOTES:

- LOGS MUST BE AT LEAST 10 INCHES IN DIAMETER AND 15 FEET LONG.
- DIG A TRENCH BELOW THE BED FOR THE UPSTREAM FOOTER LOGS AND STOCKPILE CUT MATERIAL.
- PLACE FOOTER LOGS FIRST AND THEN HEADER (TOP) LOG. SET HEADER LOG APPROXIMATELY 3 INCHES ABOVE THE INVERT ELEVATION.
- CUT A NOTCH IN THE HEADER LOG APPROXIMATELY 50 PERCENT OF THE CHANNEL BOTTOM WIDTH AND EXTENDING DOWN TO THE INVERT ELEVATION.
- PLACE FOOTER ROCK FIRST AT TAIL OF RIFFLE AND THEN HEADER ROCK.
- FOR BOTH INVERTS, INSTALL FILTER FABRIC FOR DRAINAGE BEGINNING AT THE MIDDLE OF THE HEADER AND EXTEND DOWNWARD TO THE DEPTH OF THE FOOTER, AND THEN EXTEND UPSTREAM TO A DEPTH OF FIVE FEET.
- FILL THE ENTIRE STREAMBED SIDE OF THE STRUCTURE WITH A MIX OF CLASS A STONE, CLASS B STONE, AND #57 STONE TO THE ELEVATION OF THE TOP OF THE HEADER LOG.
- UNDERCUT RIFFLE BETWEEN INVERTS BY 8 INCHES, BACKFILL BETWEEN LOGS WITH A 8 INCH MIX OF CLASS A AND B STONE TOP WITH 2 INCHES OF #57 STONE.

NOTES:

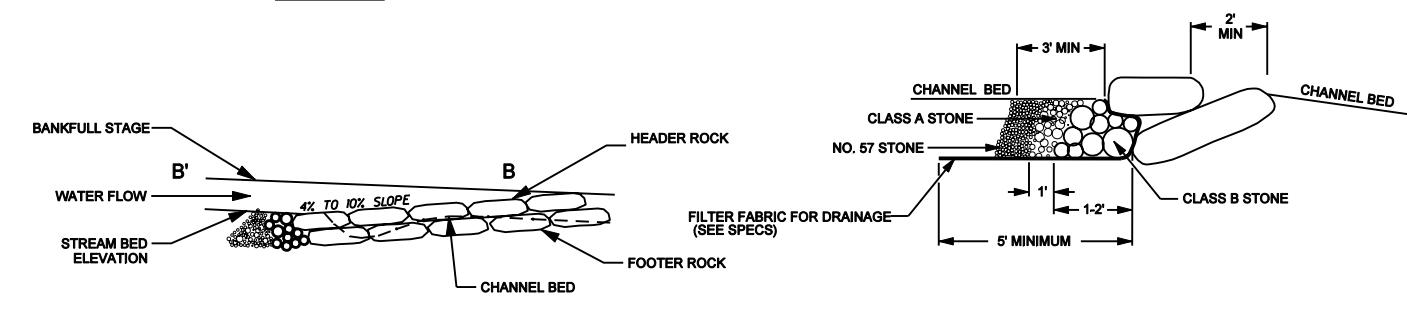

- EXCAVATE A HOLE IN THE BANK TO BE STABILIZED THAT WILL ACCOMMODATE THE SIZE OF TRANSPLANT TO BE PLACED. BEGIN EXCAVATION AT THE TOE OF THE BANK.
- EXCAVATE TRANSPLANT USING A FRONT END LOADER. EXCAVATE THE ENTIRE ROOT MASS AND AS MUCH ADDITIONAL SOIL MATERIAL AS POSSIBLE. IF ENTIRE ROOT MASS CAN NOT BE EXCAVATED IN ONE BUCKET LOAD, THE TRANSPLANT IS TOO LARGE AND SHOULD NOT BE USED.
- PLACE TRANSPLANT IN THE BANK TO BE STABILIZED SO THAT VEGETATION IS ORIENTATED VERTICALLY.
- FILL IN ANY HOLES AROUND THE TRANSPLANT AND COMPACT.
- ANY LOOSE SOIL LEFT IN THE STREAM SHOULD BE REMOVED.
- PLACE MULTIPLE TRANSPLANTS CLOSE TOGETHER SUCH THAT THEY TOUCH.

NOTES FOR ALL VANE STRUCTURES:

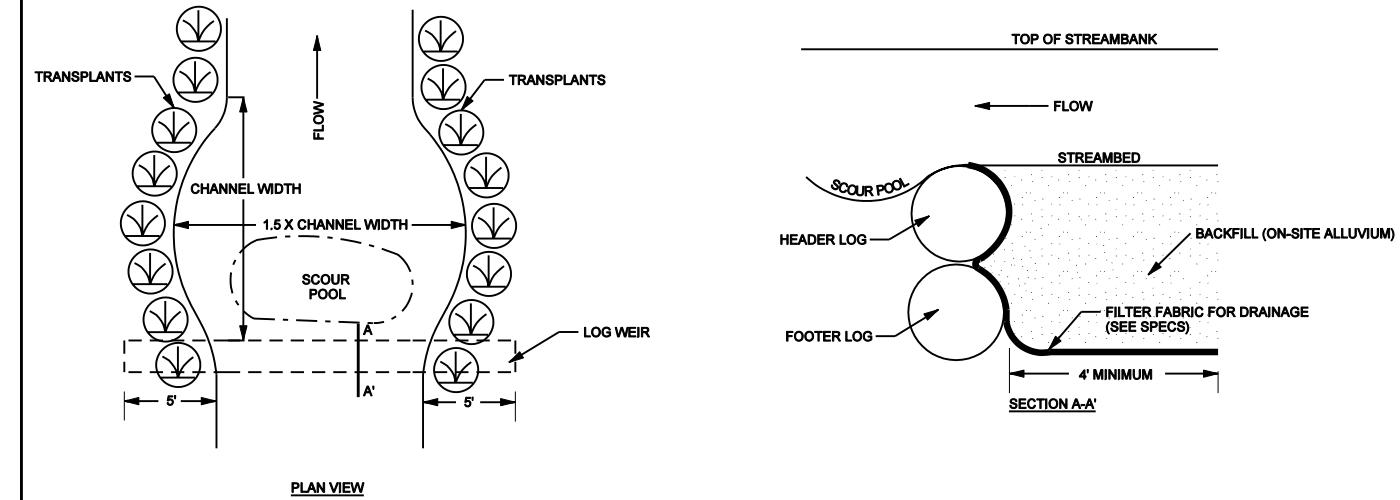

- BOULDERS MUST BE AT LEAST 2' x 2' x 2'.
- INSTALL FILTER FABRIC FOR DRAINAGE BEGINNING AT THE MIDDLE OF THE HEADER ROCKS AND EXTEND DOWNWARD TO THE DEPTH OF THE BOTTOM FOOTER ROCK, AND THEN UPSTREAM TO A MINIMUM OF FIVE FEET.
- DIG A TRENCH BELOW THE BED FOR FOOTER ROCKS AND PLACE FILL ON UPSTREAM SIDE OF VANE ARM, BETWEEN THE ARM AND STREAMBED.
- START AT BANK AND PLACE FOOTER ROCKS FIRST AND THEN HEADER (TOP) ROCK.
- CONTINUE WITH STRUCTURE, FOLLOWING ANGLE AND SLOPE SPECIFICATIONS.
- AN EXTRA BOULDER CAN BE PLACED IN SCOUR POOL FOR HABITAT IMPROVEMENT.
- USE CLASS B STONE TO FILL GAPS ON UPSTREAM SIDE OF BOULDERS, THEN CLASS A STONE IN FRONT OF CLASS B STONE, AND #57 STONE TO FILL GAPS ON UPSTREAM SIDE OF CLASS A STONE.
- AFTER ALL STONE HAS BEEN PLACED, FILL IN THE UPSTREAM SIDE OF THE STRUCTURE WITH ON-SITE ALLUVIUM TO THE ELEVATION OF THE TOP OF THE HEADER ROCK.
- START SLOPE AT BANKFULL STAGE.
