EXECUTIVE SUMMARY

Wildlands Engineering (Wildlands) completed a full-delivery project for the North Carolina Division of Mitigation Services (NCDMS) to restore and enhance a total of 18,936 linear feet (LF) of stream and restore 63.3 acres (ac) of wetlands in Johnston County, North Carolina. The project streams consist of five unnamed tributaries (UTs) to the Neuse River. The largest of these streams, Devil's Racetrack Creek (East and West), drains directly to the Neuse River. The other four streams are small headwater tributaries to Devil's Racetrack Creek (Southwest Branch, Middle Branch, Southeast Branch, and North Branch). The project proposes to provide 18,381 stream mitigation units (SMU's) and 62.1 wetland mitigation units (WMU's). At the downstream limits of the project, the drainage area is 831 acres (1.30 square miles).

The Devil's Racetrack Mitigation Site, hereafter referred to as the Site, is located in eastern Johnston County along Devil's Racetrack Road just east of its intersection with U.S. Highway 701 and approximately one mile east of Interstate 95 (Figure 1). The Site is located in the western portion of the Inner Coastal Plain Physiographic Province (USGS, 1998). The Site is located within the North Carolina Division of Water Resources (NCDWR) subbasin 03-04-02 of the Neuse River Basin (United States Geological Survey (USGS) Hydrologic Unit 03020201140010).

Prior to construction activities, the streams had been relocated and channelized and the surrounding wetland complex had been drained for agricultural purposes. The primary objectives of the project were to promote wetland hydrology; restore a Coastal Plain Small Stream Swamp wetland community; restore a Coastal Plain stream system to promote hydrologic connectivity with the floodplains and wetlands; stabilize stream banks; promote instream habitat and aeration; restore riparian buffers; and further improve water quality through removing existing agricultural practices. Figure 2 and Table 1 present the restoration and enhancement design for the Site.

The following project goals were established to address the effects listed above from watershed and project site stressors:

- Restore a large wetland complex to a naturally occurring community to improve riparian habitat and water quality;
- Restore a network of badly degraded stream channels, including multiple headwaters streams, to create aquatic habitat and further improve water quality to receiving waters; and
- Restore riparian buffers along stream corridors for additional habitat and water quality benefits.

Stream and wetland restoration and enhancement construction efforts were completed in February 2014. Baseline as-built monitoring activities (MY0) were completed between January and February 2014. A conservation easement is in place on 96.065 acres of the stream and wetland riparian corridors to protect them in perpetuity.

Monitoring Year 2 (MY2) assessment and site visits were completed between the months of April and October 2015 to assess the conditions of the project. Overall, the Site has met the required vegetation, hydrology, and stream success criteria for MY2. The overall MY2 average planted stem density for the Site is 645 stems/ acre which is greater than the year three interim density requirement of 320 stems/ acre. All restored and enhanced streams are stable and functioning as designed. Southeast Branch, Southwest Branch, and Middle Branch all had pressure transducers installed to monitor stream flow. Two of the three stream gages (Southwest and Middle Branch) met the hydrologic criteria for MY2. Of the 38 groundwater monitoring wells on the Site, 35 met the success criteria (water table with 12 inches of the

ground surface for 8.5% of the growing season consecutively) and three did not. Of the three wells that did not meet the success criteria, two showed a water table within 12 inches of the ground surface for greater than 6% of the growing season consecutively. Nineteen wells that did not meet the success criteria in MY1 did meet in MY2 as well as four wells that were added in MY2. This trend appears to demonstrate that the Site was heavily drained prior to restoration and groundwater is slowly recharging throughout the Site. It is anticipated that the wetland areas will continue to recharge and meet hydrologic success criteria in the upcoming monitoring years.

Section 1: PROJECT OVERVIEW

The Devil's Racetrack Mitigation Site, hereafter referred to as the Site, is located in eastern Johnston County within the Neuse River Basin (USGS Hydrologic Unit 03020201) near the town of Four Oaks, North Carolina. The Site is located along Devil's Racetrack Road just east of its intersection with U.S. Highway 701 and approximately one mile east of Interstate 95. The Site is located in the western portion of the Inner Coastal Plain Physiographic Province (USGS, 1998). The project watershed consists primarily of agricultural lands and forest. The only significant development in the watershed is a campground adjacent to Devil's Racetrack Creek on the western portion of the project site, a middle school in the upper portion of the watershed, a low-density subdivision with single family homes, and a small section of I-95. The drainage area for the project site is 831 acres (1.30 square miles) at the lower end of Devil's Racetrack Creek (East).

The project stream reaches include Devil's Racetrack Creek (East and West), Southwest Branch, Middle Branch, Southeast Branch, and North Branch, (stream restoration and/or enhancement level I/II approach). Mitigation work within the Site included restoration and enhancement of 18,936 linear feet (LF) of perennial and intermittent stream channel and restoration of 63.3 acres (ac) of riparian wetland. The stream and wetland areas were also planted with native vegetation to improve habitat and protect water quality. The final mitigation plan was submitted and accepted by the NCDMS in January of 2013. Construction activities were completed by Land Mechanic Designs, Inc. (East Side) and Fluvial Solutions (West Side) in February 2014. Planting and seeding activities were completed by Bruton Natural Systems, Inc. in February 2014. Baseline monitoring (MYO) was conducted between December 2013 and April 2014. Annual monitoring will be conducted for seven years with the close-out anticipated to commence in 2021 given the success criteria are met. Appendix 1 provides more detailed project activity, history, contact information, and watershed/site background information for this project.

A conservation easement has been recorded and is in place along the stream and wetland riparian corridors to protect them in perpetuity; 96.065 ac (Deed Book 4221, Page 419-433) within two tracts owned by Nell Howell Revocable Trust. The project provides 18,381 stream mitigation units (SMU's) and 62.1 wetland mitigation units (WMU's). Directions and a map of the Site are provided in Figure 1 and project components are illustrated in Figures 2a and 2b.

1.1 Project Goals and Objectives

Prior to construction activities, the streams had been relocated and channelized and the surrounding wetland complex had been drained for agricultural purposes. Stream valleys and other low areas were filled to raise wet areas and even out the fields. At the same time the streams were straightened and riparian vegetation was also removed. The project area west of Devil's Racetrack Road was used for row crop agriculture and the eastern portion was used for timber production.

The channelization of streams on the Site resulted in severely over-enlarged channels that were extremely deep in many locations. The alterations of the Site to promote farming practices resulted in complete elimination of the ecological function of this small stream/wetland complex. Specifically, functional losses at the Site include degraded aquatic habitat, altered hydrology (related to loss of floodplain connection and lowered water table), and reduction of quality and amount of riparian wetland habitats and related water quality benefits. Ongoing bank erosion was also occurring at some locations due to high, overly steep banks and lack of bank vegetation. Table 4 in Appendix 1 and Tables 10a through 10f in Appendix 4 present the pre-restoration conditions in detail.

The Site was designed to meet the over-arching goals as described in the mitigation plan (Wildlands, 2013). The project is intended to provide numerous ecological benefits within the Neuse River Basin. While many of these benefits are limited to the Devil's Racetrack Creek Site project area, others, such as pollutant removal and improved aquatic and terrestrial habitat, have more far-reaching effects. The following project specific goals established in the mitigation plan include:

- Restore a large wetland complex to a naturally occurring community to improve riparian habitat and water quality;
- Restore a network of badly degraded stream channels, including multiple headwaters streams, to create aquatic habitat and further improve water quality to receiving waters; and
- Restore riparian buffers along stream corridors for additional habitat and water quality benefits.

Secondary project goals established in the mitigation plan were to restore fish passage from the Neuse River to Devil's Racetrack Creek. This is a secondary goal because success will not be measured during monitoring.

The primary project goals were addressed through the following project objectives:

- Promote wetland hydrology by raising channelized stream beds and filling drainage ditches;
- Plant wetland areas with native tree species to restore a Coastal Plain Small Stream Swamp Blackwater Subtype community;
- Reconstruct stream channels to have the appropriate slope, planform, and cross-sectional geometry for the region of the Coastal Plain in which the project is located;
- Size reconstructed stream channels to flood floodplains and wetlands frequently;
- Stabilize stream banks using bioengineering, natural channel design techniques, and grading to reduce bank angles and bank height;
- Install in-stream structures and woody debris to promote aeration of water, create habitat, and influence the creation of bed forms commonly found in sand bed channels;
- Restore riparian buffer areas with native tree species to stabilize channels, filter flood flows and runoff, and supplement wetland plantings; and
- Remove project area from agricultural production further improving water quality.

The design streams and wetlands were restored to the appropriate type based on the surrounding landscape, climate, and natural vegetation communities but also with strong consideration to existing watershed conditions and trajectory. The mitigation project was developed to restore a large stream/wetland complex directly adjacent to the Neuse River to a naturally occurring community to create riparian and wetland habitat and improve water quality. Other key factors addressed in the design were to create stable habitats, improve riparian buffers, and restore the natural migration patterns for anadromous and other fish for spawning.

1.2 Monitoring Year 2 Data Assessment

Annual monitoring and quarterly site visits were conducted during MY2 to assess the condition of the project. The stream and wetland mitigation success criteria for the Site follow the approved success criteria presented in the Devil's Racetrack Mitigation Plan (Wildlands, 2013).

1.2.1 Vegetative Assessment

A total of 51 vegetation plots were established during the baseline monitoring within the project easement areas. All of the plots were installed using a standard 10 meter by 10 meter plot. The final

vegetative success criteria will be the survival of 210 planted stems per acre in the riparian corridor along restored and enhanced reaches and within the wetland restoration areas at the end of the seven year monitoring period (MY7). The interim measure of vegetative success for the Site will be the survival of at least 320 planted stems per acre at the end of year three of the monitoring period (MY3) and at least 260 stems per acre at the end of the fifth year of monitoring (MY5).

The MY2 vegetative survey was completed in June 2015. The 2015 vegetation monitoring resulted in an average planted stem density of 645 stems per acre, which is greater than the interim requirement of 320 stems/acre required at MY3, but approximately 8% less than the baseline density recorded at MY0, 702 stems/acre, in January 2014. When including volunteer stems, the average stems/acre is 722. This is well above the MY3 interim requirement of 320 stems/ acre. There was an average of 16 stems per plot which is a slight decrease from 17 stems per plot in MY1. All 51 of the vegetation plots individually met success criteria for MY2, and are on track to meet the success criteria required for MY7 (Table 9, Appendix 3). Refer to Appendix 2 for vegetation plot photographs and the vegetation condition assessment table and Appendix 3 for vegetation data tables.

1.2.2 Vegetation Areas of Concern

Along the lower section of Devil's Racetrack (East), there are several bare areas (approximately 15.5% of the planted acreage). In these bare areas, the planted trees appear healthy and volunteer trees have sprouted, but the herbaceous ground cover is still deficient and not well established. This area was graded down several feet during construction which removed the top soil, leaving a more acidic subsoil. Wildlands incorporated liquid and pelletized lime into the soil during construction with the expectation that the pH would increase over the first year or two and would provide better herbaceous growing conditions. As of MY2, this area still has low pH soils, but continues to improve as the herbaceous ground cover density develops. Additional permanent seed, temporary seed, lime, and fertilizer was added during MY2 to promote better ground cover. Wildlands will continue to monitor these areas and will reapply seed and soil amendments as necessary. Refer to Appendix 2 for the vegetation condition assessment table, the Integrated Current Condition Plan View (CCPV), and reference photographs.

1.2.3 Stream Assessment

Morphological surveys for MY2 were conducted in April 2015. All streams within the Site are stable and met success criteria for MY2. In general, cross sections for all streams showed little to no change in bankfull area, maximum depth ratio, or width-to-depth ratio. Surveyed riffle cross sections fell within the parameters defined for channels of the appropriate Rosgen stream type.

Cross section 8 on Devil's Racetrack (West) has maintained a consistent bankfull width, but has increased in depth and area. This is due to the location of the cross section within the shallow. The shallow was built with logs buried at the stream bed elevation, perpendicular to the stream banks, for grade control. These logs create downstream micro pools within the shallow. Cross section 8 was placed downstream of one of these logs in a micro pool. These micro pools are expected and the increase in depth and area of cross section 8 is typical in micro pools. Cross Section 8 is stable and performing as expected, even though there is an increase in depth and area.

Longitudinal profile surveys are not required on the project unless visual inspection indicates reach wide vertical stability concerns. Refer to Appendix 2 for the visual stability assessment table, the CCPV map, and reference photographs. Refer to Appendix 4 for the morphological data and plots.

1.2.4 Stream Areas of Concern

In the spring of 2015 minor bank erosion was repaired between stations 103+00 and 107+00 on Devils Racetrack Creek (East). The repair work consisted of regrading banks, seeding, matting, addition of native transplants and live staking. As of the fall of 2015, the vegetation is better established in this area and the stream banks appear to be stable.

Southeast Branch also had minor repair work performed in the spring of 2015. Several areas between stations 309+00 and 315+00 required repairs to log grade control structures. These structures were sealed with native stone to stabilize them. Also, several meander bends were repaired by installing native sod mats and transplants for bank stabilization. Below this area where the stream slope decreases, sediment that had accumulated in the channel was removed and deposited on the adjacent, stabilized floodplain. Wildlands assumes that the sediment deposition resulted from runoff of the adjacent farm fields prior to the riparian buffer becoming well established. Wildlands will continue to monitor the sediment deposition along Southeast Branch in future monitoring years.

1.2.5 Hydrology Assessment

At the end of the seven year monitoring period, two or more bankfull events must have occurred in separate years within the restoration reaches. Multiple bankfull events were recorded on all the streams with crest gages and pressure transducers during the MY2 data collection. All streams on the Site had multiple bankfull events during MY1. Therefore, the Site has met the required stream hydrology success criteria.

Pressure transducers were also installed on Southwest Branch, Southeast Branch, and Middle Branch to measure stream flow. These pressure transducers were installed to show that the streams have adequate flow throughout the year, and are not ephemeral ditches. Per discussion with the Interagency Review Team (IRT), on these three streams, consistent flow must be documented for at least 30 consecutive days under normal circumstances. Stream flow must be documented to occur intermittently in all months other than July through September. Southwest and Middle Branch showed consistent flow throughout MY2. Southeast Branch had a malfunction with the pressure transducer and Wildlands was unable to retrieve the data from the pressure transducer. The pressure transducer was replaced on July 30, 2015 and data has been recorded from this point on during MY2. Since being replaced, the pressure transducer on Southeast Branch has recorded multiple bankfull events and flow for a maximum of 16 consecutive days. During MY1 one pressure transducer was lost during a flood, so Wildlands decided to make the other pressure transducers more secure during MY2. The pressure transducer for Southwest and Middle Branch were reinstalled to make them more secure, and keep them from washing away. Two of the three streams have met the flow success criteria for MY2. The third stream had a malfunction with the pressure transducer for part of the year so it is unknown if it met flow success criteria. Refer to Appendix 5 for hydrologic data.

1.2.6 Wetland Assessment

Thirty four groundwater monitoring gages were established during the baseline monitoring within the wetland restoration zones. During MY2 four more gages were added to help assess groundwater levels on the Site. All the gages were installed at appropriate locations so that the data collected will provide an indication of groundwater levels throughout the Site. To provide data for the determination of the growing season, one soil temperature probe was installed. A barotroll logger (to measure barometric pressure used in the calculations of groundwater levels with well transducer data) and a rain gage were also installed on the Site. All monitoring gages were downloaded on a quarterly basis and maintained on an as needed basis. The success criteria for wetland hydrology is to have a free groundwater surface

within 12 inches of the ground surface for 8.5 percent of the growing season, which is measured in consecutive days under typical precipitation conditions. During MY1 NRCS WETS Data was used to determine the growing season for the Site. After discussions with the United States Army Corps of Engineers (USACE), it was agreed to use on-site soil temperature data to determine the beginning of the growing season and use NRCS WETS data to determine the end of the growing season. During MY2 the beginning of the growing season was extended by 18 days based on soil temperatures staying above 41 degrees Fahrenheit at 12 inches below the ground surface.

The USACE also requested pre-construction groundwater well data be overlaid on hydrographs with the current monitoring year groundwater well data. USACE requested this data to see how groundwater levels are recharging after rain events on the Site. Wildlands overlaid the pre-construction groundwater well data with the closest monitoring groundwater well data and rain data. It is evident from these overlays that the Site drained more rapidly and to greater depths prior to restoration. Refer to Appendix 5 for pre and post construction groundwater gage comparison plots.

Of the 38 groundwater monitoring wells on the Site, 35 met the success criteria and 3 did not for MY2. The 35 wells that met the success criteria generally exceeded the standard significantly. The measured hydroperiod ranged from 12.0% to 32.4% with 17 wells exceeding 20% of the growing season. Prior to project construction, Wildlands anticipated that it might take a year or two to see hydrology rebound on the site due to the heavily ditched and drained pre-restoration conditions. A comparison of MY1 and MY2 monitoring results appears to support this concept. The MY2 hydrology results are significantly wetter than the MY1 results where only 12 of 34 wells met the success criteria. This improved performance came despite the fact that the 2014 rainfall total through October was 22 inches greater than the measured rainfall total in 2015 through the same period.

Of the 3 wells that did not meet the success criteria, two (Gage 1 and 34) showed the water table within 12 inches of the ground surface for 6% of the growing season consecutively. It is also worth noting that these two wells would have met for approximately 12% of the growing season had they not dropped to approximately 13 inches for two consecutive days in March. The third well (Gage 10) that did not meet showed the water table within 12 inches of the ground surface 4% of the growing season. This well was very dry in MY1 as well (0.6% hydroperiod). While the 2015 results are an improvement, this well will be monitored closely during the remainder of the monitoring period.

Groundwater wells 8 and 32 were placed outside of proposed wetland restoration boundaries to provide data to potentially increase the wetland restoration boundary. The wetland restoration area around well 8 was modified during Mitigation Plan review due to concerns about drainage from a section of the abandoned Devils Racetrack Creek that could not be filled. Since this channel was left open and could possibly drain the proposed wetlands, a conservative wetland restoration boundary was agreed upon. The MY2 well 8 results appear to indicate that the channel is not draining the area around the well, and that wetland restoration boundaries extend farther than expected. Similarly, groundwater well 32 was placed downstream of proposed wetland restoration boundaries to see if wetland restoration boundaries extended farther than the hydrology model indicated they would. During MY2 well 32 showed a similar hydrograph to wells upstream in a wetland restoration area that met success criteria. These results appear to indicate that wetland restoration boundaries extend farther downstream than expected. Refer to Appendix 2 for the groundwater gage locations and Appendix 5 for groundwater hydrology data and plots.

1.2.7 Maintenance Plan

No maintenance plan is necessary at this time. Wildlands will continue to monitor Southeast Branch and the floodplain area adjacent to the lower section of Devil's Racetrack (East). A maintenance plan will be

developed if it becomes apparent that Southeast Branch continues to have aggradation and degradation problems. In addition, if the floodplain area adjacent to the lower portion of Devil's Racetrack (East) does not continue to improve herbaceous cover, Wildlands will develop a maintenance plan to establish grasses.

1.3 Monitoring Year 2 Summary

All streams within the Site are stable and functioning as designed. There were a few areas on Southeast Branch and Devil's Racetrack (East) that were repaired during MY2. These areas will be monitored for any future issues and a maintenance plan will be prepared if necessary. The average stem density for the Site is on track to meeting the MY7 success criteria; all individual vegetation plots meet the MY2 success criteria as noted in the CCPV. There have been at least two documented bankfull events recorded by the crest gages on each of the streams on the Site. A total of 35 out of 38 groundwater gages met the wetland hydrology success criteria, and the Site is showing a significant trend in groundwater recharge. This trend is fully expected to continue in the future.

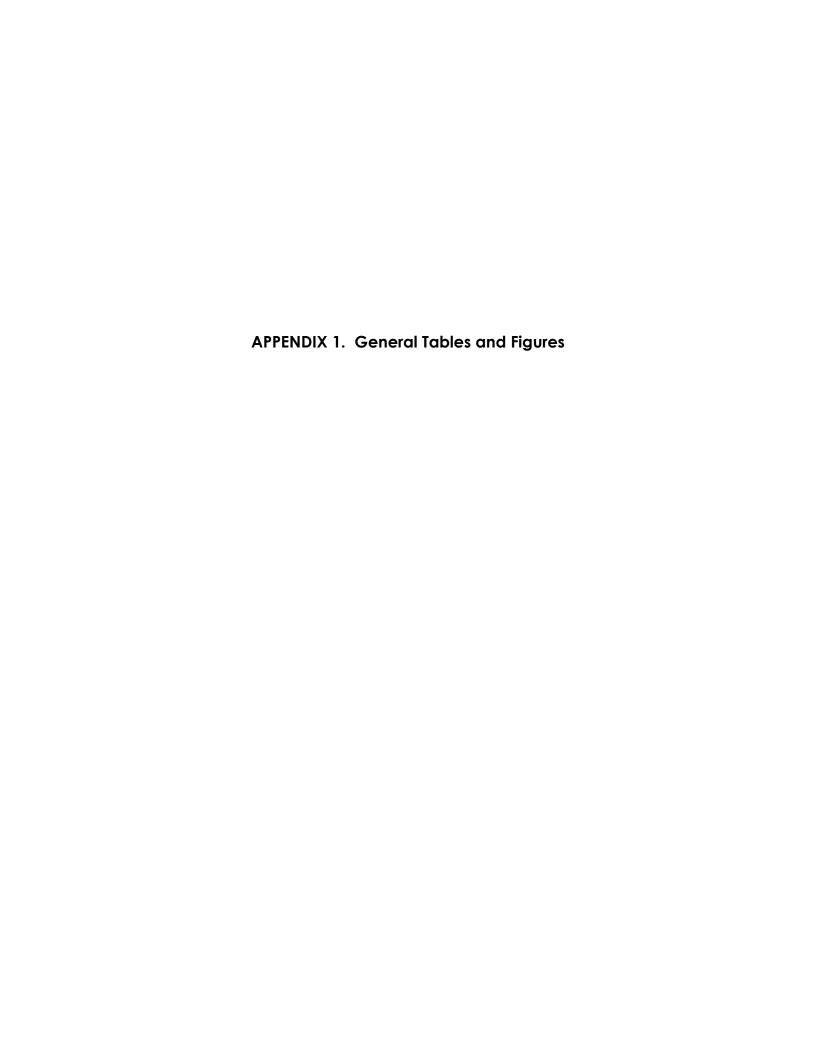

Summary information and data related to the success of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the Mitigation Plan documents available on NCDMS's website. All raw data supporting the tables and figures in the appendices are available from NCDMS upon request.

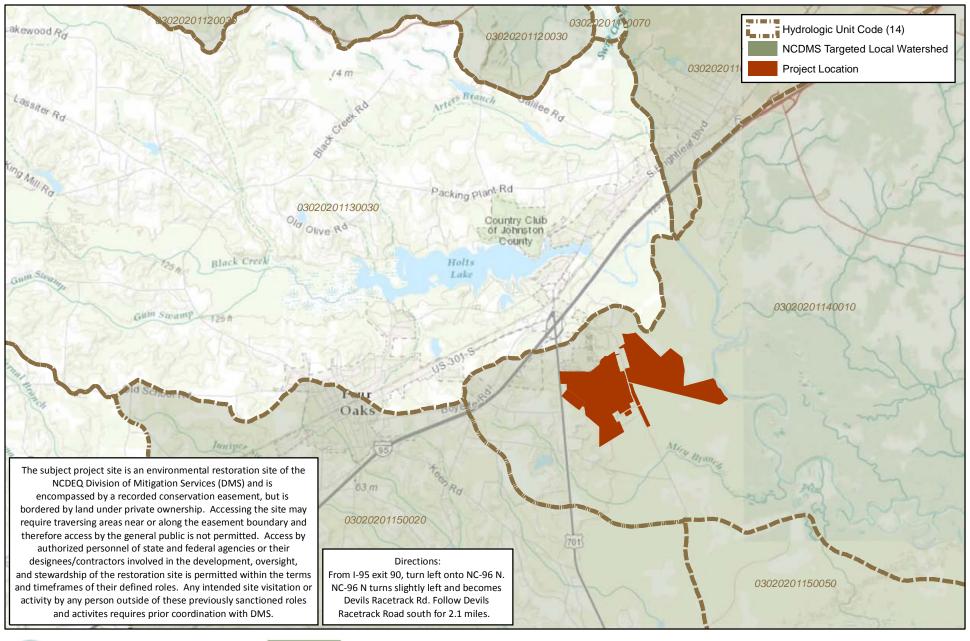

Section 2: METHODOLOGY

Geomorphic data was collected following the standards outlined in The Stream Channel Reference Site: An Illustrated Guide to Field Techniques (Harrelson et al., 1994) and in the Stream Restoration: A Natural Channel Design Handbook (Doll et al., 2003). All the Integrated Current Condition Mapping was recorded using a Trimble handheld GPS with sub-meter accuracy and processed using Pathfinder and ArcGIS. Crest gages and pressure transducers were installed in surveyed riffle cross sections and monitored quarterly. Hydrology attainment installation and monitoring methods are in accordance with the USACE (2003) standards. Vegetation monitoring protocols followed the Carolina Vegetation Survey-NCDMS Level 2 Protocol (Lee et al., 2008).

High Quality Preservation	-	-	-	-		-		

N/A: not applicable

1. Ratio of 4:1 based on an expected 75% reduction in credits for stream restoration with shrub buffer zone in power line easements

2. Credits updated from baseline report during monitoring year 1 due to errors in calculations.

Table 2. Project Activity and Reporting History

Devil's Racetrack Mitigation Site (NCDMS Project No.95021)

Monitoring Year 2 - 2015

Activity or Report	Date Collection Complete	Completion or Scheduled Delivery	
Mitigation Plan	September 2011- March 2012	January 2013	
Final Design - Construction Plans	September 2011- March 2012	August 2013	
Construction	December 2013- February 2014	February 2014	
Temporary S&E mix applied to entire project area ¹	February 2014	February 2014	
Permanent seed mix applied to reach/segments	February 2014	February 2014	
Bare root and live stake plantings for reach/segments	February 2014	February 2014	
Baseline Monitoring Document (Year 0)	December 2013- February 2014	May 2014	
Year 1 Monitoring	August 2014	December 2014	
Year 2 Monitoring	October 2015	December 2015	
Year 3 Monitoring	2016	December 2016

Table 4. Project Information and Attributes

Devil's Racetrack Mitigation Site (NCDMS Project No.95021)

Monitoring Year 2 - 2015

Project Information						
Project Name Devil's Racetrack Mitigation Site						
County	Johnston County					
Project Area (acres)	96.065 ac					
Project Coordinates (latitude and longitude)	35° 27'01.58" N, 78° 23' 18.08" W					
Project Watershed Summary Information						
Physiographic Province	Upper Coastal Plain					
River Basin	Neuse					
USGS Hydrologic Unit 8-digit	03020201					
USGS Hydrologic Unit 14-digit	03020201140010					
DWR Sub-basin	03-04-02					
Project Drainiage Area (acres)	831 ac					
Project Drainage Area Percentage of Impervious Are	<1%					
CGIA Land Use Classification	62% forest/wetland, 34% farm land, 4% developed					

Reach Summary Information

Parameters	Southwest Branch	Middle Branch	Southeast Branch	North Branch	Devil's Racetrack Creek (west)	Racetra	vil's ck Creek ast)
Length of reach (linear feet) - Post-Restoration	0	0	0	0	5,273	5,5	562
Drainage area (acres)	20.6	10.8	69.9	49.9	493.5	83:	1.4
NCDWR stream identification score	34.5 - 37	30	29 - 30.75	32	38	37	7.5
NCDWR Water Quality Classification			C/	NSW			
Morphological Desription (stream type)	Р	Р	P/I	Р	Р	ı	P
Evolutionary trend (Simon's Model) - Pre- Restoration							
Underlying mapped soils					Goldsboro sandy lo amy sand, and Ra		
Drainage class							
Soil Hydric status							
Slope							
FEMA classification			N	one			
Native vegetation community	Coastal Plain bottomland riparian forest						
Percent composition exotic invasive vegetation -Post- Restoration	0%						

Regulatory Considerations

Regulation	Applicable?	Resolved?	Supporting Documentation
Waters of the United States - Section 404	Х	Х	USACE Nationwide Permit No.27 and DWQ 401 Water
Waters of the United States - Section 401	Х	Х	Quality Certification No. 3885.
Division of Land Quality (Dam Safety)	N/A	N/A	N/A
Endangered Species Act	х	x	Devils Racetrack Mitigation Plan; Wildlands determined "no effect" on Johnston County listed endangered species.
Historic Preservation Act	Х	Х	No historic resources were found to be impacted (letter from SHPO dated 7/20/2011).
Coastal Zone Management Act (CZMA)/Coastal Area Management Act (CAMA)	N/A	N/A	N/A
FEMA Floodplain Compliance	N/A	N/A	The project streams do not have an associated regulatory flooplaing; however the downstream end of Devil's Racetrack Creek is located within the floodwasy and flood fringe of the Neuse River (FEMA Zone AE, FIRM panel 1680).
Essential Fisheries Habitat	N/A	N/A	N/A

Table 8. CVS Vegetation Table - Metadata

Devil's Racetrack Mitigation Site (NCDMS Project No. 95021)

Monitoring Year 2 - 2015

Database name	Devils Racetrack MY2 cvs-eep-entrytool-v2.3.1.mdb
Database location	F:\Projects\005-02129 Devil's Racetrack\Monitoring\Monitoring Year 2\Vegetation Assessment
Computer name	JASON-PC
File size	52690944
DESCRIPTION OF WORKSHEETS IN THIS	DOCUMENT
Metadata	Description of database file, the report worksheets, and a summary of project(s) and project data.
Proj, planted	Each project is listed with its PLANTED stems per acre, for each year. This excludes live stakes.
Proj, total stems	Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems.
Plots	List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.).
Vigor	Frequency distribution of vigor classes for stems for all plots.
Vigor by Spp	Frequency distribution of vigor classes listed by species.
Damage	List of most frequent damage classes with number of occurrences and percent of total stems impacted by each.
Damage by Spp	Damage values tallied by type for each species.
Damage by Plot	Damage values tallied by type for each plot.
Planted Stems by Plot and Spp	A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded.
ALL Stems by Plot and spp	A matrix of the count of total living stems of each species (planted and natural volunteers combined) for each plot; dead and missing stems are excluded.
PROJECT SUMMARY	
Project Code	95021
project Name	Devils Racetrack Mitigation Site
Description	Stream and Wetland Mitigation
River Basin	Neuse
Sampled Plots	51
