

# **Freedom Park (Little Sugar Creek) Final Monitoring Report Year 2 of 5 (2006)**

**Mecklenburg County, North Carolina**

**USGS HUC: 03050103**

**Project ID No. 141**

Prepared for:

**NCDENR-Ecosystem Enhancement Program  
1652 Mail Service Center  
Raleigh, North Carolina 27699-1652**

January 2007

## Executive Summary

The Freedom Park Stream Restoration project falls within USGS hydrologic unit **03050103**. The project stream lies within an urban setting of the City of Charlotte that is comprised of predominantly residential and commercial uses. Prior to restoration work, the project stream (Little Sugar Creek) had been destabilized through historic channelization and dredging. Also, prior to restoration work, the channel consisted of a concrete lining.

HDR Engineering designed the restoration plans and restoration was completed in 2003. Kimley-Horn and Associates (KHA) performed stream and riparian monitoring during 2006 for this Year 2 Monitoring Report. During the late growing season, KHA assessed six (6) vegetation quads including two (2) newly installed quads. Combined stem count density for all the quads equaled approximately 587 stems per acre for planted stems; exceeding year 3 success criteria. Kudzu has invaded most of the channel reach and may interfere with vegetation goals if not managed.

A stream assessment including a visual assessment and geomorphic survey indicated that the project reaches were performing mostly within established success criteria ranges. Several isolated sections showed bank erosion and a few structures were stressed or failing. Most of the project reach continues to be stable. The geomorphic measurements are within the range of the design parameters.

Appendix A: Vegetation Monitoring Data

Appendix B: Stream Monitoring Data

# 1.0 Project Background

The background information for this report references previous monitoring reports submitted by the Biological and Agricultural Engineering Department at North Carolina State University and Soil and Environmental Consultants, PA.

## 1.1 Location and Setting

The Little Sugar Creek stream restoration site lies within in the Catawba River Basin (HU No. 03050103) in Mecklenburg County, North Carolina. East Boulevard and Princeton Avenue bound the upper and lower endpoints of the stream reach and the site lies entirely within Freedom Park and the City of Charlotte. Freedom Park is part of the Mecklenburg County Park and Recreation Department public park system. (See Figure 1)

## 1.2 Project Structure, Mitigation Type, Approach and Objectives

Little Sugar Creek was dredged in 1917 to a minimum width of approximately 20 feet and a depth of 8 feet. Overall, the current alignment has existed since the early part of the 1900s. In the mid-1960s and early 1970s, the City initiated an erosion control system along the banks of Little Sugar Creek, as it flows through Freedom Park, using a combination of grouted riprap and concrete bank covering. In July 2002, the County removed the grouted riprap and concrete banking and temporarily stabilized the banks with erosion control matting. Additionally, the large flood control weir structure located approximately 450 feet upstream of Princeton Avenue was removed.

The restoration plan proposed to increase aquatic habitat diversity, improve on-site water quality, stabilize the stream banks, provide flood storage, and aesthetically enhance the stream setting.

Table I provides project mitigation structure and objectives:

**Table I: Project Restoration Components**

Table I. Project Restoration Components Little Sugar Creek Stream Restoration Site (EEP Project #141)							
Project Segment or Reach ID	Existing Feet / Acres	Type	Approach	Footage or Acreage	Mitigation Ratio	Mitigation Units	Stationing Comment

## Project History and Background

Construction of the Little Sugar Creek Stream Restoration project began in mid-2003 and ended in September 2003. The As-built survey was completed in June 2004. Year 2 monitoring occurred during 2006. Table II provides additional details regarding the timeline of the project.

**Table II: Project Activity and Reporting History**

### **1.3 Monitoring Plan View**

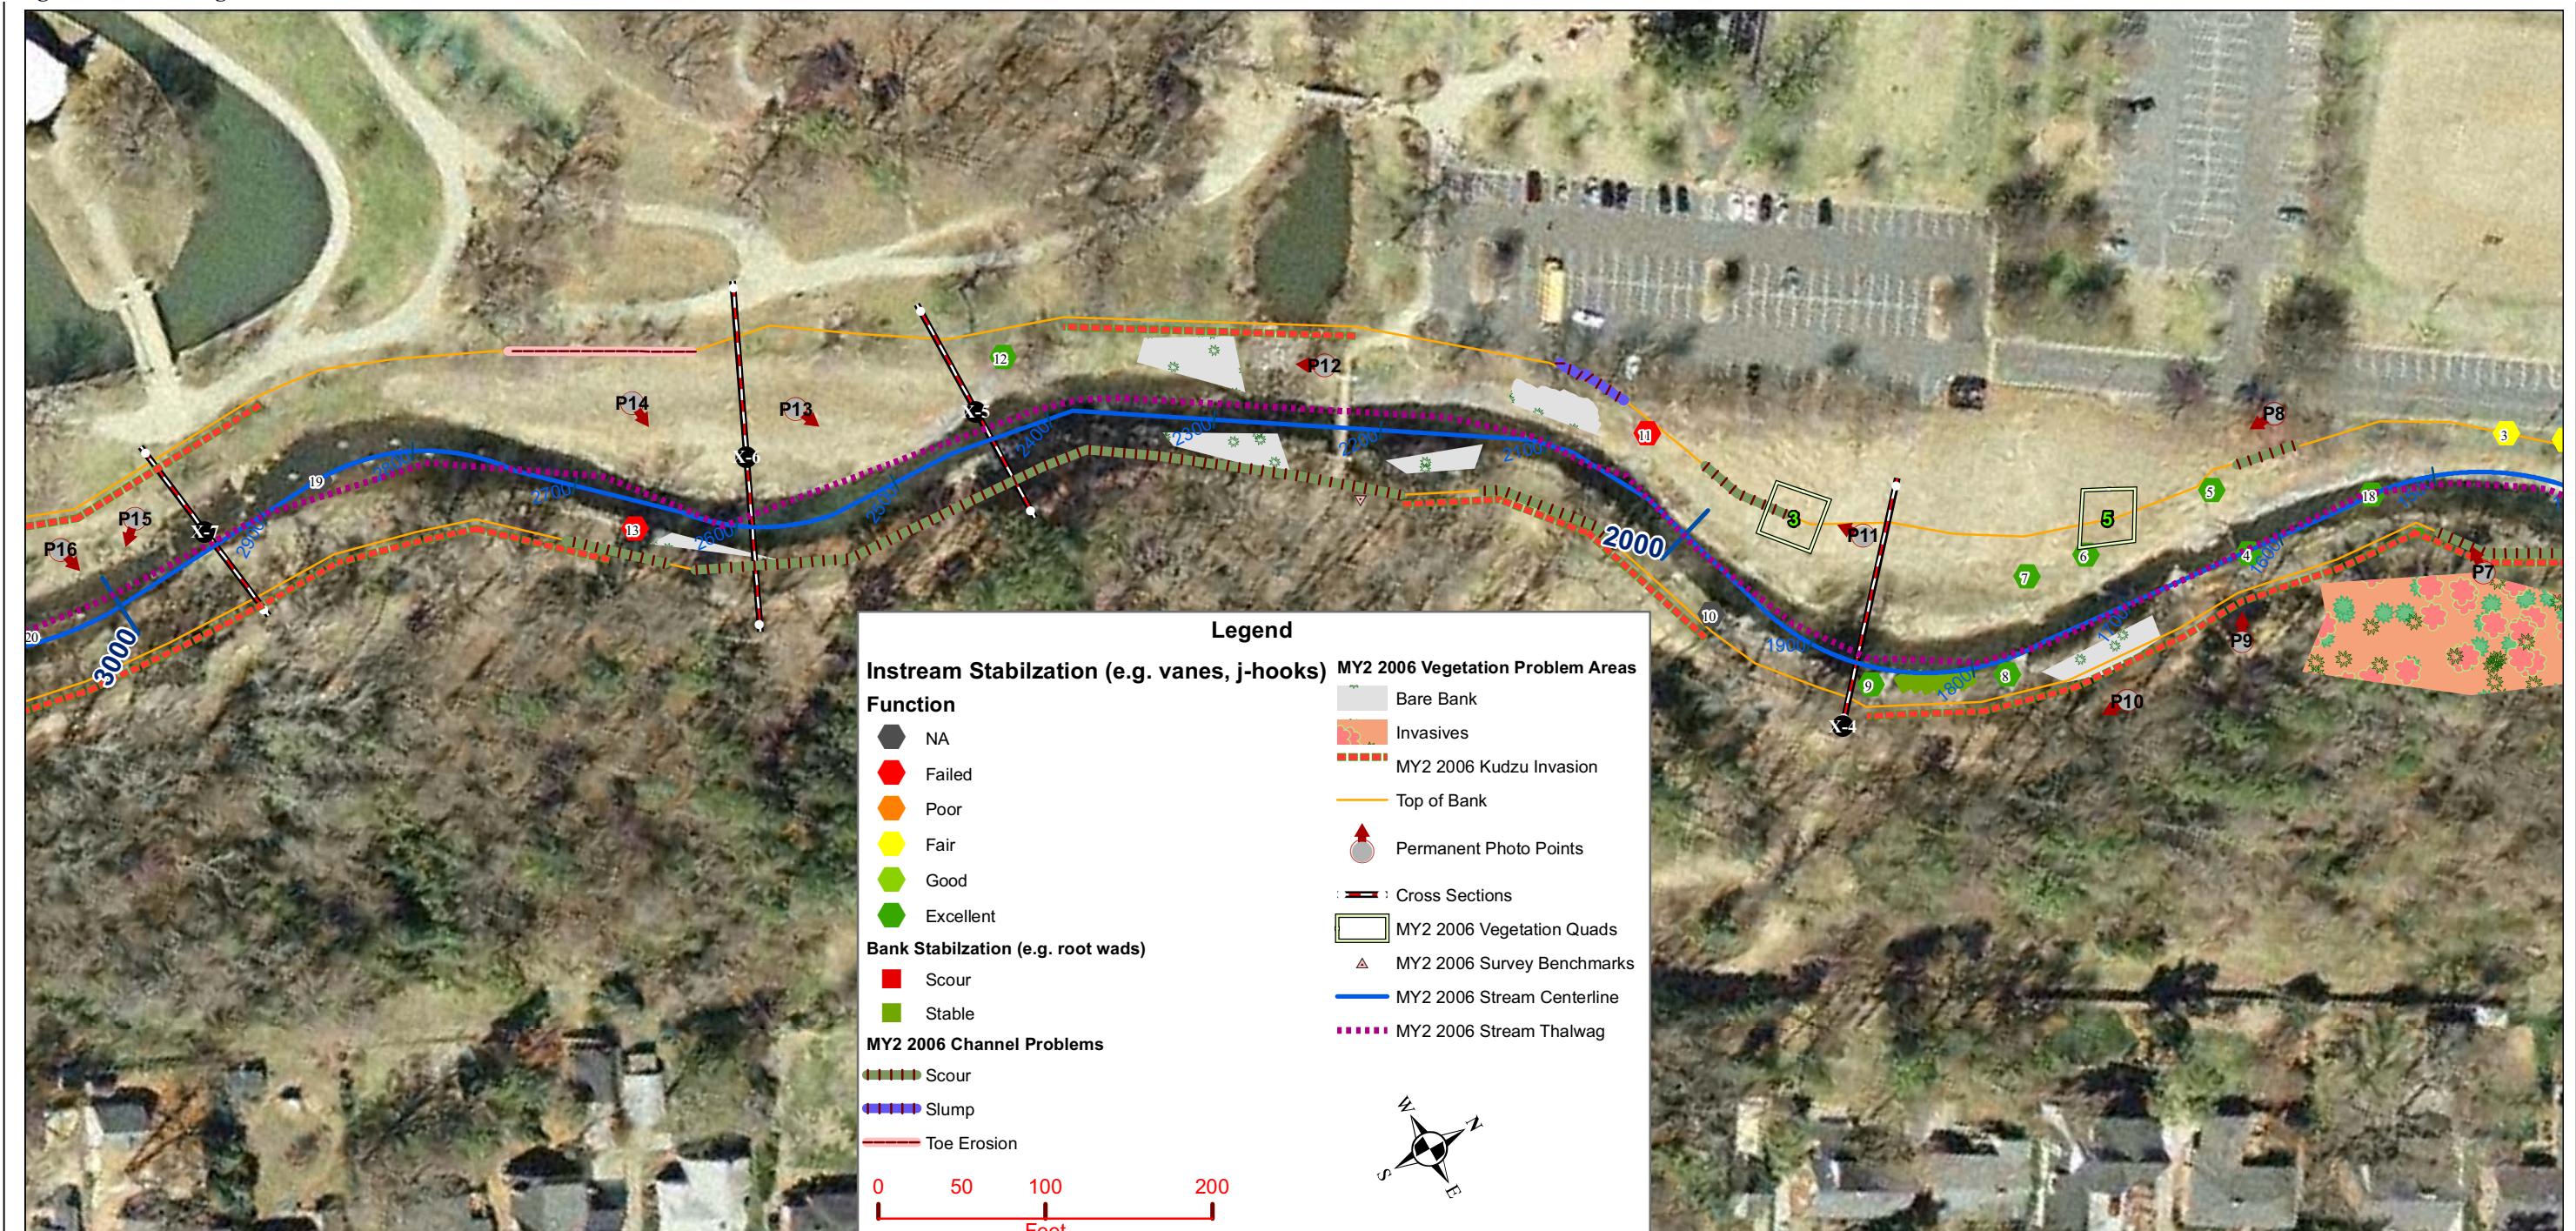

The monitoring plan assesses the project stream's geomorphology using a set of nine (9) cross sections located throughout the project reach. The longitudinal profile and pattern assessment covered the entire reach. Twenty-three (23) permanent photo points provide for a visual comparison of key site features through time. The monitoring plan uses six (6) randomly placed vegetation quads to assess riparian buffer restoration. Monitoring Plan View Sheets 1 to 3 show the locations of the monitoring features.

## **2.0 Project Conditions and Monitoring Results**

### **2.1 Vegetation Assessment**

Planted zones related to the stream restoration consisted of the riparian buffer zone and the stream banks. The riparian buffer zone begins at the top of the bank and continues out perpendicular from the stream. The planted stream bank begins at the normal base flow elevation and extends to the top of bank or interface with the flood plain.

KHA reassessed four (4) existing vegetation plots and established two (2) additional plots as directed by NC-EEP.

KHA assessed site vegetation in September and October, 2006. Kudzu has invaded much of the site. An interview with a park user suggests that a local community group within Charlotte has a program to combat invasives. Many sections of the reach exhibit bare banks. As noted in previous monitoring reports, the cause of the bare banks may be due to a lack of root development capable of withstanding stresses to during flood flows and/or compacted soils inhibiting vegetation growth. One section of floodplain appears to have been cleared and now exhibits early successional growth including invasives from areas surrounding the riparian buffer. Appendix A provides a summary of vegetative problem areas. Figures 2-4 show the problem areas.

KHA conducted a vegetation assessment during the early fall of 2006. The stem count table in appendix A summarizes the results of the vegetation sample. Each of the original four (4) plots and two (2) new plots meet success criteria for planted stem counts. The plot summary also shows that in several plots, species such as *Betula nigra*, *Acer negundo*, *Populus deltoids*, *Fraxinus pennsylvanicum*, and *Liquidambar styraciflua* are rapidly colonizing.

## 2.2 Stream Assessment

KHA assessed the stream channel during the spring and fall of 2006. Several isolated sections exhibited bank scour. Causes of scour may include lack of vegetative establishments; frequent flooding flows; unstable soils; and failed short-term protection such as coir fiber matting. Two areas utilizing boulder toe protection had pools developing behind them. Most structures seemed to remain in place and functional. Several structures previously mapped as J-Hooks appeared as rock vanes in the field. The headers were either missing or difficult to view because they may have been buried by sediment. One structure appeared to be missing completely; one structure appeared to be missing a header rock; and one structure had a collapse of boulders making up the arm. Several root wads were located in the field but were not previously mapped. A set of root wads near the bottom of the reach showed severe scour behind the root balls. Monitoring Plan View Sheets 1 through 3 show the location of the stream problem areas and table B1 in appendix B summarizes the stream problem areas.

KHA performed a database search and document review to locate information concerning measurement of bankfull events. The research found a functional gage approximately 2,600 feet upstream of the project reach. The gage has a twelve (12) year period of record. This period is too short to estimate bankfull discharge based on peak discharges. A visit to the gage location is required to estimate bankfull hydraulic geometry relative to gage height or discharge. Table V provides a listing of probable bankfull events based on site observations and limited gage data.

**Table V: Verification of Bankfull Events**

Table V. Verification of Bankfull Events Little Sugar Creek Stream Restoration Site (EEP Project #141)			
Collection	Date of Occurrence	Method	Photo #
10/1/2006	Before 10/1/2006	Photographed On-Site	BE1

KHA did not find documentation of bank erosion estimates from previous site assessments. NC-EEP has scheduled a bank erosion assessment for a later date. Table VI that is intended to summarize sediment export estimates has no values but has been included in this section as a placeholder for future completion.

	Total								
Post-Construction									
	Total								

<sup>1</sup> Data missing or unavailable<sup>2</sup> Assessment planned for later date

Table VII provides a categorical view of the stream visual stability assessment. The visual assessment shows an apparent decrease in stability related to meanders; in-stream stabilization (e.g. vanes, j-hooks); and bank stabilization (e.g. wads and boulders). Meander instability relates to floodplain relief and erosion of outer bends. Five (5) of the eleven (11) meander bends appear to have point bars that do not provide sufficient floodplain access. This may improve as the channel continues to adjust. KHA observed recent sediment deposition downstream of eroding outer banks that is likely a sign of adjustment. Table B2 in appendix B provides a breakdown of the visual assessment.

**Table VII: Categorical Stream Features Visual Stability Assessment**

Table VII. Categorical Stream Feature Visual Stability Assessment Little Sugar Creek Stream Restoration Site (EEP Project #141)

H. Wads and Boulders	--	100%	35%	--	--	--

Tables VII and IX summarize the site geomorphic assessment. KHA determined bankfull using a combination of upstream gage data, urban piedmont regional curves, and site indicators. Site indicators were not universally prominent throughout the reach likely due to the young age of the channel. KHA used gage data and regional curve data to verify the site indicators. This analysis led to new bankfull elevations that differed from previous elevations. All data from the previous surveys (i.e. the as-built and year 1 survey) was adjusted to match the year 2 bankfull elevations. The field investigators had difficulty identifying cross section benchmarks in the field; therefore some of the cross sections had a slightly different alignment than previous year's cross sections. The difference in alignment negates a very fine comparison between years for a cross section but does allow for the identification of significant changes in cross section. The cross sections did not show a significant change in the shape or area compared to earlier years. Appendix B provides raw data, photographs, and graphing for geomorphic data.

### **3.0 Methodology**

KHA adjusted some of the methodologies for data collection for monitoring year 2. Per NC-EEP's request, KHA added two additional vegetation plots and performed the vegetation survey using the EEP – Carolina Vegetation Survey (CVS) protocol. During the geomorphic survey, KHA added additional benchmarks and captured the location and elevation of new existing benchmarks. The new existing benchmarks are maintained by the City of Charlotte. Previous year's spatial data did not provide an indication of established benchmarks.

**APPENDIX A**  
**VEGETATION MONITORING DATA**

Table VI. Vegetative Problem Areas  
Little Sugar Creek Stream Restoration Site (FEP Project #141)

Feature/Issue	Station # / Range	Probable Cause	Photo #
Bare Bank	410 - 1,140 (Both Banks)	Excessive bank stresses during yearly flooding events	VP 2
	1,690 - 1,750 (Left Bank)		
	2,065 - 2,350 (Both Banks)		
Bare Bench	--	--	--
Bare Flood Plain	1,250 - 1,580 (Left Floodplain)	Cleared area exhibiting successional growth including invasives from local source colonization after bank scour	VP 4
	35 - 1,030 (Both Banks)		
	1,240 - 1,860 (Left Bank)		
Invasive/Exotic Populations	1,250 - 1,580 (Left Floodplain)	Cleared area exhibiting successional growth including invasives from local sources	VP 4
	1,950 - 2,190 (Left Bank)		VP 3
	2,210 - 2,380 (Right Bank)		VP 1
	2,680 - 3,065 (Left Bank)		
	2,690 - 3,555 (Right Bank)		
	3,555 - 3,790 (Left Bank)

## **APPENDIX B**

## **STREAM MONITORING DATA**

Table B1. Stream Problem Areas					
				Suspected Cause	Photo number
Feature Issue	Reach	Station numbers	Description		
<u>Aggradation/Bar Formation</u>					
		945 - 1,140	Bank Scour (Both Banks)	Excessive shear stresses	
		315 - 320	Bank Scour (Left Bank)	Stormwater Drain	
		1,260 - 1,330	Bank Scour (Left Bank)	Excessive shear stresses	
		1,310 - 1,390	Bank Scour (Right Bank)	Excessive shear stresses	
		1,395 - 1,500	Bank Scour (Left Bank)	Excessive shear stresses	SP 1
		1,570 - 1,620	Bank Scour (Right Bank)	Excessive shear stresses	
		1,940 - 2,015	Bank Scour (Right Bank)	Excessive shear stresses	
		2,040 - 2,140	Bank Scour (Left Bank)	Excessive shear stresses	SP 4
		2,190 - 2,700	Bank Scour (Left Bank)	Excessive shear stresses	SP 5
		2,625 - 2,740	Scour behind toe protect (Right Bank)	Excessive shear stresses	SP 2
		3,270 - 3,340	Bank Scour (Left Bank)	Excessive shear stresses	
		3450	Scour behind toe protection (Right Bank)	Excessive shear stresses	SP 6
		4,030 - 4,070	Scour (Left Bank) - Possibly displaced root wads	Excessive shear stresses	SP 7
<u>Engineered structures – back or arm scour</u>					
Etc.		1,260	Missing header rock	Excessive shear stresses	
		1,960	Missing structure	Excessive shear stresses	
		2,660	Arm boulder collapse	Excessive shear stresses	
		3,950 - 4,140	Scour behind root wads	Excessive shear stresses	SP 3

SP 1: Scout on left bank with failing rock stabilization

SP 2: Scour behind boulder toe protection

SP 3: Scour behind root wads

SP 4: Bare left bank

SP 5: Scour on left bank

SP 6: Scour on Right Bank

SP 7: Scour between root wads – possible displacement of root wads

BE 1: Indication of high flows – possibly bankfull
