# I. Executive Summary/Project Abstract

The North Carolina Department of Transportation (NC DOT) conducted a restoration on 3,687 feet of Hanging Rock Creek and an unnamed tributary. The creek is located in Avery County, North Carolina and is in the Watauga River Basin. The Hanging Rock Creek watershed comprises three square miles and is part of the Elk River drainage, eight-digit hydrologic unit code 06010103.

Prior to restoration, Hanging Rock Creek exhibited unstable gravel beds (Rosgen classification C4 and E4) with bank heights ranging from 1.3-1.9. Due to past land use, the riparian vegetation was cleared, the channel was straightened and there was uncontrolled grazing in and around the channel. For these reasons, the result channel was eroded and widened and there was a loss of channel bed form diversity. This caused erosion with an estimated sediment load of 25 tons per year.

The stream restoration stabilized the channel and reduced bank erosion and sediment pollution. Woody plants were established along the corridor, which also helped stabilize the channel and reduce erosion and sediment. Collectively, these objectives help reach the project goal of improved water quality. Two additional goals were to improve aquatic, in-stream, habitat diversity and the natural aesthetics of the stream corridor.

The 2005 monitoring illustrated general success in achieving the goals of this restoration project. The channel is stable, aquatic habitat appears good, most of the banks are well vegetated, and there are few problem areas. None of the problem areas are considered significant.

## II. Project Background

### *1. Location and Setting*

The North Carolina Department of Transportation (NC DOT) conducted a restoration on 3687 feet of Hanging Rock Creek and an unnamed tributary. The creek is located in Avery County, North Carolina and is part of the Watauga River Basin. The Hanging Rock Creek watershed comprises three square miles and is part of the Elk River drainage, eight-digit hydrologic unit code 06010103.

The project site is 4/5 of a mile southeast of the downtown intersection of Banner Elk. The creek crosses North Carolina Highway 184 about 160 feet south of the intersection with Dobbins Road (SR 1337). The restoration project reach starts where the creek crosses under Dobbins Road and ends at the North Carolina Highway 184 bridge.

The project is part of a 45-acre tract that includes residential and commercial low-density development and a 12.6 acre conservation easement that includes the floodplain of the restoration project up to the 100 year floodplain elevation. The site also contains wetland restoration and storm water BMP's for the new construction. The landowner was interested in protecting water quality and the local trout fishery habitat. The project is divided into two reaches, Hanging Rock Creek (Reach 1) which starts at Dobbins Road and continues to North Carolina Highway 184 and the unnamed tributary (Reach 2) which starts at a fence line along the southeast portion of the property and flows northwest into the middle of Reach 1. There is also a section of wetland enhancement and a pond that were designed to treat stormwater from the new residential construction.

## **2. Structure and Objectives**

Prior to restoration, Hanging Rock Creek exhibited unstable gravel beds (Rosgen classification C4 and E4) with bank heights ranging from 1.3-1.9. Past land use cleared riparian vegetation, straightening the channel and uncontrolled grazing in and around the channel. The result was an over-widening channel, loss of channel bed form diversity and an estimated sediment load of 25 tons per year lost to the stream. (see 2<sup>nd</sup> paragraph in Executive Summary)

The restoration stabilized the stream, reduced bank erosion and sediment pollution, the riparian vegetation was also restored and woody plants were established along the corridor. These goals work together to improve water quality. Additional goals were to improve aquatic in-stream habitat diversity and improve natural aesthetics of the stream corridor. (see 3<sup>rd</sup> Paragraph of Executive Summary)

<b>Table I. Project Structure Table</b>	
<b>Project Number and Name: 165 (Hanging Rock Creek)</b>	
<b>Segment/Reach ID</b>	<b>Linear Feet or Acreage</b>
Hanging Rock Creek - Reach 1	2311 feet (existing) 2808 (restored)
Unnamed Tributary to Hanging Rock Creek	817 feet (existing) 879 (restored)

<b>Table II. Project Objectives Table</b>			
<b>Project Number and Name: 165 (Hanging Rock Creek)</b>			
<b>Segment/Reach ID</b>	<b>Objectives</b>	<b>Linear Feet or Acreage</b>	<b>Comment</b>
Hanging Rock Creek / Reach 1	Restoration	2808 feet	Restore Stream Dimension, Pattern and Profile
Unnamed tributary to Hanging Rock Creek/ Reach 2	Enhancement	879 feet	New pattern, profile, dimension and structures

## **3. Project History and Background**

The Hanging Rock Creek mitigation project was in the planning stages during 2001. North Carolina Ecosystem Enhancement Program (NC EEP) provided EcoLogic with the Draft Mitigation Plan and Design dated August 2001. EcoLogic requested additional information on this project from NC EEP, however, they were unable to provide additional documentation.

EcoLogic contacted Mr. Kevin Tweedy of Buck Engineering, the name written on the plan view drawings. Mr. Tweedy sent EcoLogic a set of hand drawn sketches. These sketches were used during construction and are undated. These sketches were useful to document some discrepancies between the draft plan and what was observed on the ground during monitoring.

For these reasons, EcoLogic does not know the dates of construction or when planting was done. It is also EcoLogic's understanding that no as-built survey was conducted. Due to the uncertainties of construction dates, EcoLogic is not comfortable calling this monitoring the as-built. The vegetation suggests that the project was constructed at least two years ago. EcoLogic assumes that the 2005 data is the first year monitoring data, but we have no project timeline or supplementary data that indicates the project schedule for sure.

### **III. Project Condition and Monitoring Results**

#### **A. Vegetation Assessment**

##### **1. Soil Data**

The soils along Hanging Rock Creek are classified as Cullowhee loam with characteristic very deep profiles, frequent flooding and a slope of less than 3%. These soils have somewhat poor drainage but rapid permeability and a low shrink swell potential. The seasonal high water table appears between 1.5 and 2.0 feet and these soils have very low erosion potential. The surface contains significant amounts of organic material and is typically dark brown. The subsoil is typically a brown loam with dark grayish brown iron depletions. Underlying material usually contains a dark gray sandy loam with yellowish brown iron accumulations. Cobbles increase in number with increasing depth.

<b>Table VI. Preliminary Soil Data</b>

*No table X exists because it was not applicable for this project.*

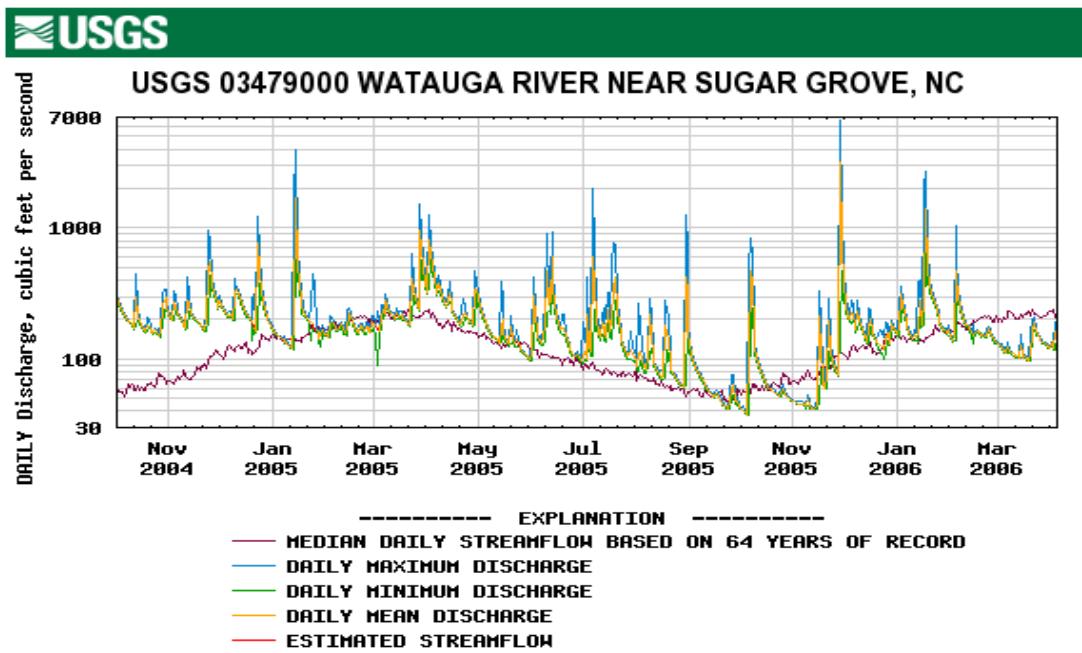

### **6. Quantitative Morphology**

No crest gages are installed at this site to document bankfull events. Therefore, potential occurrence was extrapolated based on USGS stream gage discharge data for the Watauga River near Sugar Grove, NC. The gage is located about 6 miles of the project site in the same watershed and has a drainage area of 92 square miles. An estimate of the number of bankfull events in 2005 was made by comparing the stream discharges from the USGS data in cubic feet per second (cfs) against the bankfull discharge estimated from the drainage area on the Rural Piedmont NC Regional Curve. According to the regional curve, a bankfull event occurs on a stream with a 92-mi<sup>2</sup> drainage area when the discharge is about 2,300 cfs. Based on this primary surrogate USGS data, an estimated two (2) bankfull events occurred in 2005.

## IV. Methodology Section

The methods used to generate the data in this report are standard fluvial geomorphology techniques as described in *Applied River Morphology*, 1996, D.L. Rosgen and related publications from US Forest Service and the interagency Stream Mitigation Guidelines, 2003, USACOE, USEPA, NCWRC, NCDENR-DWQ.

EcoLogic's field morphology survey was conducted using a Nikon total station and the data was analyzed and displayed using RiverMorph version 3.1 software. The pebble counts were conducted using Pocket RiverMorph software and a PDA. The vegetation problem areas and structural problem areas were noted in the field on the PDA.

Photographs were taken at medium-high resolution using a Nikon Coolpix 4600 digital camera.

GPS location information was collected using a Trimble Geo XT handheld mapping grade GPS unit. GPS locations were collected on all problem areas, photo points and at least one corner of each vegetation-monitoring plot.

EcoLogic conducted field monitoring without the benefit of an as-built or MY1 report or data, so we relied on visual and electromagnetic surveys to attempt to locate prior monitoring features. In spite of these efforts, we could not locate prior feature indicators in the field. Consequently, new monitoring features were established, including cross-sections, vegetation plots, etc.

Vegetation monitoring plots were marked in the field by placing a steel conduit with blue flagged at each corner. In addition, the up-stream, outside corner was marked with a three foot length of white plastic pipe tied with orange flagging. Individual plants in the monitoring plots were tied with white flagging.

### Appendix B.3

Table B1a. Qualitative Visual Stability Assessment						
Project Number: 00165						
Segment/Reach: Hanging Rock Creek						
Feature Category	Metric (per as-built and reference baselines)	(# Stable) Number performing as intended	Total number per as-built	Total number / feet in unstable state	% Perform in stable condition	Feature Perform. Mean or Total
A. Riffles	1. Present?	20	20	0	100	
	2. Armor stable (e.g. no displacement)?	20	20	0	100	
	3. Facet grade appears stable?	20	20	0	100	
	4. Stable interval grade?	20	20	0	100	
	5. Feature spacing appropriate?	20	20	0	100	
	6. Minimal evidence of embedding/fining?	20	20	0	100	
	7. Depth appears appropriate for current discharge?	20	20	0	100	
	8. Length appropriate?	20	20	0	100	
						100
B. Pools	1. Present? (e.g not subject to severe aggradation?) 4	20	20	0	100	
	2. Sufficiently deep (Max Pool D:Mean Bkf >1.6?)	20	20	0	100	
	3. Thalweg located outer bend?	20	20	0	100	
	4. Spacing appropriate?	20	20	0	100	
	5. Non-aggrading (not filling)?	18	20	2/197	90	
	6. Length appropriate?	20	20	0	100	
C. Thalweg	1. Upstream of meander bend (run/inflection) centering?	20	20	0	100	
	2. Downstream of meander (glide/inflection) centering?	20	20	0	100	
D. Meanders	1. Outer bend in state of limited/controlled erosion?	20	20	0	100	20
	2. Of those eroding, # w/concomitant point bar formation?	0	NA	0	NA	NA
	3. Apparent Rc within spec?	NA	NA	NA	NA	NA
	4. Sufficient floodplain access and relief?	20	20	0	100	20
E. Bed - General	1. General channel bed aggradation areas (bar formation)	All	NA	None	100	
	2. Channel bed degradation – areas of increasing down-cutting or head cutting?	All	NA	None	100	
F. Channel Capac./Dimen.	1. Channel width: depth appears out of design/type spec?	All	NA	None	100	
G. Banks	1. Apparent scour points from channel processes	All	NA	None	100	

Table B1a. Qualitative Visual Stability Assessment						
Project Number: 00165						
Segment/Reach: Hanging Rock Creek						
Feature Category	Metric (per as-built and reference baselines)	(# Stable) Number performing as intended	Total number per as-built	Total number / feet in unstable state	% Perform in stable condition	Feature Perform. Mean or Total
	2. Apparent cut points from overland flow	All	NA	None	100	
	3. Apparent cut or scour from flood water re-entry to channel (e.g. inadequate floodplain access?)	All	NA	None	100	NA
	4. Tension cracks	All	NA	None	100	NA
	5. Unstable cantilever blocks (e.g. height/undercut/soil type versus vegetation penetration and extent)	All	NA	None	100	NA
	6. Bank gradient in excess of 40%?	All	NA	None	100	NA
	7. Collapse/slumping	All	NA	None	100	NA
	8. Ratio of bank height: bankfull height elevated	All	NA	None	100	NA
H. Vanes	1. Free of back or arm scour?	16	16	0	100	16
	2. Height appropriate?	16	16	0	100	16
	3. Angle and geometry appear appropriate?	16	16	0	100	16
	4. Free of piping or other structural failures?	16	16	0	100	16
I. Wads/ Boulders	1. Free of scour?	All	NA	None	100	NA
	2. Footing stable?	All	NA	None	100	NA

<b>Table B1b. Qualitative Visual Stability Assessment</b>						
<b>Project Number: 00165</b>						
<b>Segment/Reach: UT to Hanging Rock Creek</b>
