## EXECUTIVE SUMMARY

The Harrell Stream and Wetland Restoration Site is a full-delivery project that was developed for the North Carolina Ecosystem Enhancement Program (EEP). Construction was completed in September 2007 on an Unnamed Tributary to Swift Creek and 15.0 acres of Coastal Plain Small Stream Swamp wetland community. The 441-acre watershed at the downstream limits of the project stream and the 57-acre watershed draining into the project wetland are located within the USGS 14-digit HUC 03020101130090 and the NCDWQ Sub-basin 03-03-02 in the Tar-Pamlico River Basin. The project restored 6,808 linear feet of channel using a combination of Priority 2 and 3 approaches, and 15.0 acres of Coastal Plain Small Stream Swamp wetland community, generating 6,808 stream mitigation units and 15.0 wetland mitigation units. The stream design addressed vertical instability problems and a lack of bed variability by stabilizing stream banks, installing in-stream structures, adjusting stream planform, and replanting the riparian areas with native vegetation. The wetland was restored by filling ditches, creating microtopography, and planting native trees and shrubs. This report describes the results from the findings of the fourth year of monitoring that took place in 2011.

The riparian buffer was planted with twelve different species of bare root trees and shrubs and three different species of live stakes. The restored wetland was planted with eleven different species of bare root trees and shrubs. Vegetation monitoring plots were established during the as-built survey and included 18 monitoring plots placed throughout the stream buffer and 12 monitoring plots installed in the restored wetland. Vegetation must meet a minimum survival success rate of 260 stems/acre after five years. Between the second and third monitoring years supplemental planting was conducted on isolated sections of the stream restoration. The fourth-year monitoring counted an average of 573 stems/acre in the stream plots and 517 stems/acre in the wetland plots. The fourth-year monitoring found the vegetation component of the project to be on track to meeting the success criteria.

The stream assessment completed during fourth-year monitoring found the stream to be stable and functioning properly. Channel dimensions have not changed significantly from the first-year monitoring. The small portions of localized bed erosion, aggradation, and degradation that were noted during previous monitoring years have not become problematic or caused any instability in the stream. Any problem areas noted during the fourth-year monitoring have been documented in the Current Condition Plan View. The on-site stream gauges have recorded multiple bankfull events since the project was constructed in September 2007.

During the 2011 monitoring year, wetland hydrology was achieved at all four wells in the restoration area. In 2011 groundwater was within 12 inches of the soil surface for at least 16 consecutive days (7% of the growing season) at each well, which exceeds the 5% success criteria.

The daily rainfall data depicted on the gauge data graphs were obtained from the on-site precipitation gauge. The precipitation gauge was installed on the site prior to project implementation. The daily rainfall data obtained from a local weather station shows that the area had average to below average rainfall during the 2011 growing season and correlated to the precipitation data recorded on-site.

## **1.0 PROJECT BACKGROUND**

### **Project Goals and Objectives**

The goals and objectives of the restoration project are as follows:

#### *Restoration Goals:*

- Protect aquatic resources from excess nutrients, sediment, and other pollutants coming from the agricultural watershed.
- Reestablish terrestrial and aquatic habitat and connect the site to the existing floodplain corridor along Swift Creek.

#### *Restoration Objectives:*

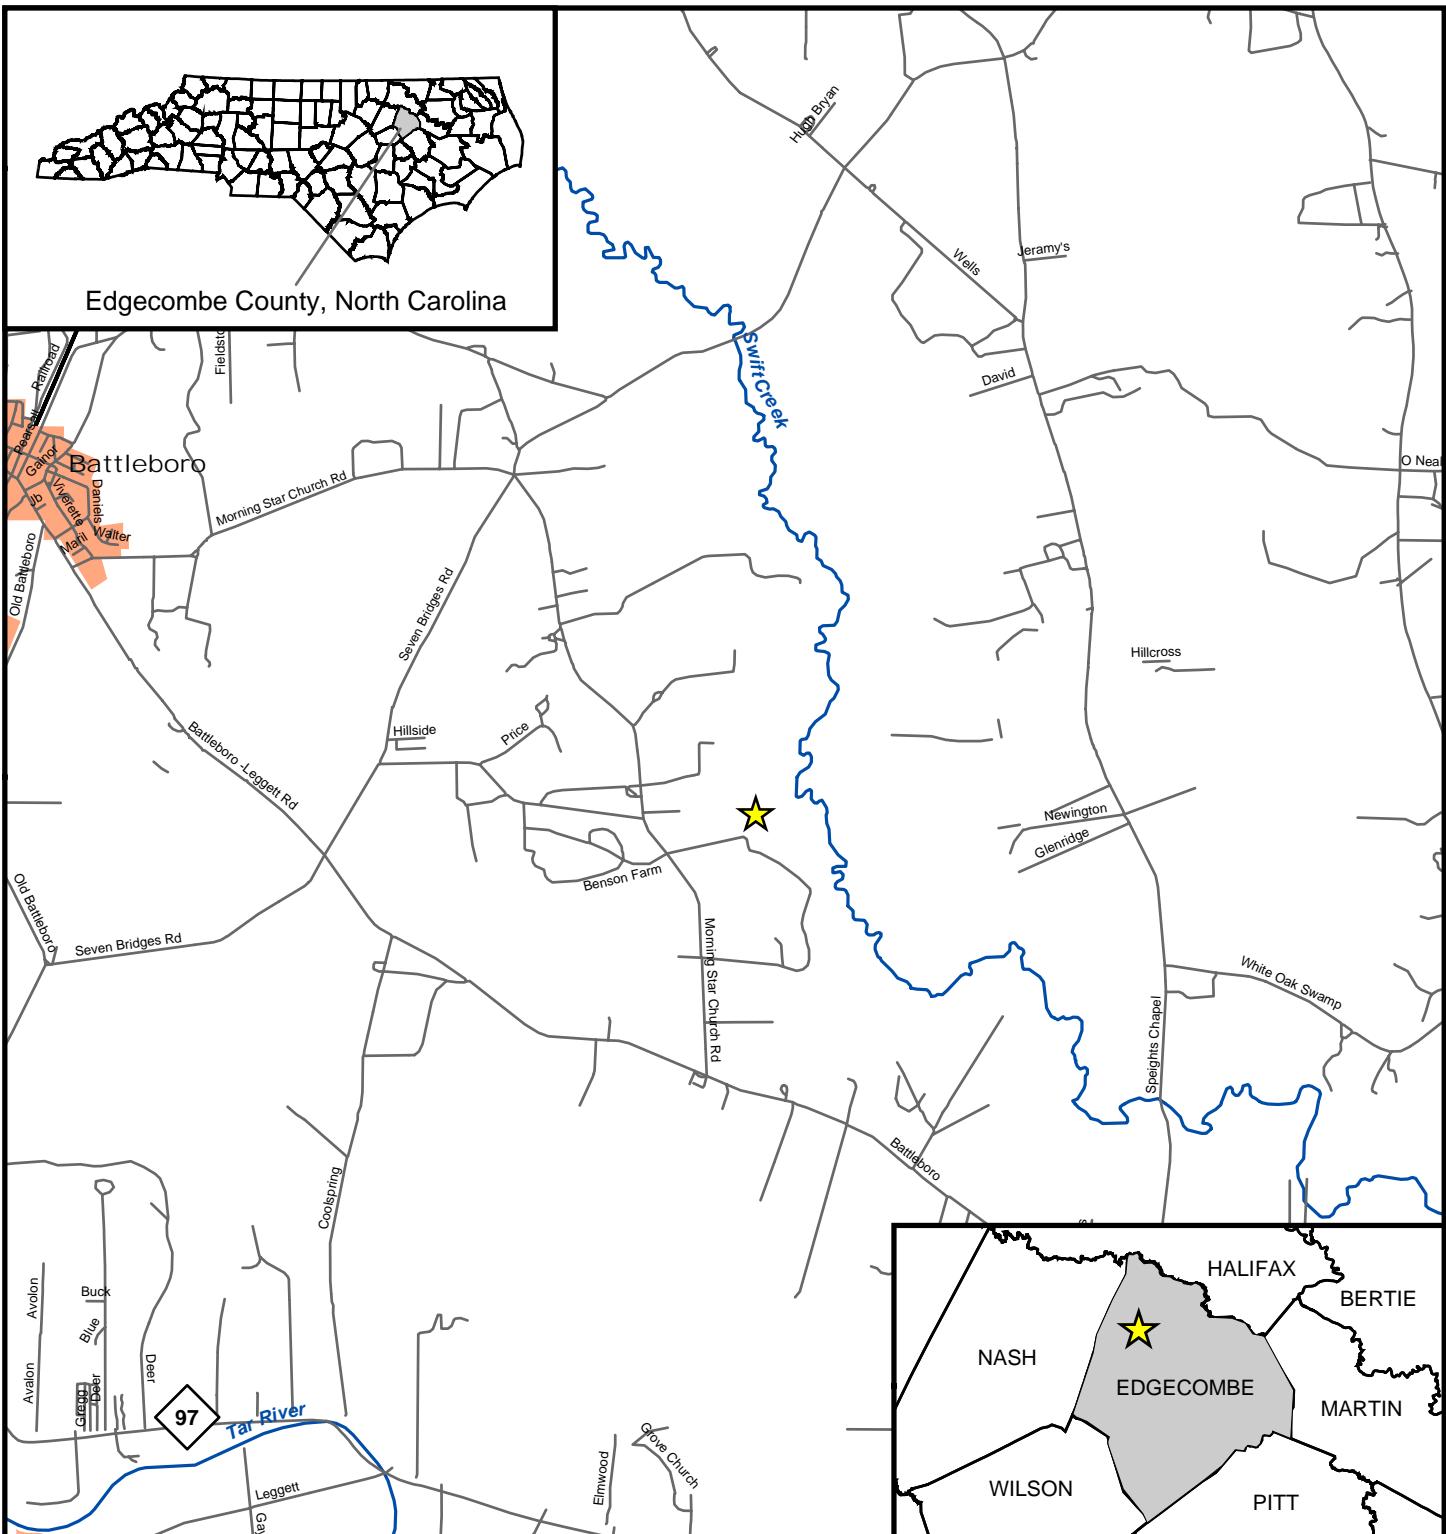

- Restore 6,808 linear feet of stable stream channel with the appropriate pattern, profile, and dimension that can support a sand transport system.
- Connect the stream to a functioning floodplain.
- Fill and plug ditches in the drained hydric soils to restore saturated hydrologic conditions for 5% of the growing season.
- Plant tree species typical of a Coastal Plain Small Swamp Stream along the stream riparian corridor and floodplain as well as in the restored wetland.

## **1.1 Project Structure, Restoration Type, and Approach**

Prior to restoration, UT to Swift Creek had been channelized and straightened since at least 1948. The entire site, including where the wetland was restored, was under agricultural production. There were fields adjacent to the stream and the wetland that had been drained by a network of ditches. There were no remaining vegetated buffers or instream features in the channel and the banks were nearly vertical. The channel was characterized as having poor streambed variability and habitat diversity. Restoration of 6,808 linear feet of channel was accomplished utilizing a combination of Priority Levels 2 and 3 (Table 1). Reach 1 (Station 10+00 to 22+26) was restored using a Priority Level 3 approach. The restoration of a B5c channel with a sinuosity of 1.06 was accomplished by building a bankfull channel with a higher width/depth ratio than the existing stream, creating distinct bed features by adding pools and riffles to the profile, and grading back the upper slopes to create an appropriate valley for the stream. Reaches 2, 3, and 4 (Stations 22+26 to 36+91, 36+91 to 51+82, and 51+82 to 78+80, respectively) were restored to a C5 channel with a Priority Level 2 restoration. The restoration established a bankfull channel with a new floodplain where the designed bankfull stage equals the new floodplain elevation (bank height ratio=1.0). Reaches 2, 3, and 4 have sinuosity values of 1.07, 1.23, and 1.10, respectively. The four different reaches are shown in Figure 2.

## **1.2 Location and Setting**

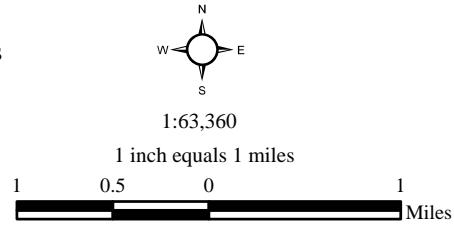

The Harrell Stream and Wetland Restoration Site is located approximately six miles northeast of Rocky Mount, North Carolina in Edgecombe County (Figure 1). The latitude and longitude of the project site are 36.0201 North and 77.6807 West (WGS1984). To reach the site from Raleigh, proceed east on U.S. Route 264-East/64-East (US 264E/64E) for approximately 17 miles. Continue on US 64E for another 30 miles. Take the U.S. Route 301 Bypass and then U.S. Route 301 (US 301) north into Battleboro. Make a right onto Battleboro-Leggett Road and then turn left onto Morning Star Church Road just outside of town. Proceed through Cherry Crossroads and continue for 2.25 miles. The project site is on the left side of Morning Star Church Road and is directly opposite the junction with Benson Farm Road.

## **2.0 PROJECT CONDITIONS AND MONITORING RESULTS**

### **2.1 Vegetation Assessment**

The planted vegetation on the site is growing well. There are isolated spots of sparse vegetation throughout the stream site due to poor soil being exposed in the floodplain during the Priority 2 restoration. Also, due to backwater from Swift Creek, the downstream portion of the stream buffer floods frequently, drowning out trees planted in this area. Supplemental planting was conducted in the winter of 2009/2010 and 2010/2011.

The low stream flow throughout the summer allows vegetation to become established in the stream channel. This vegetation includes grasses, rushes, cattails, and Asian dayflower (*Murdannia keisak*). During the past four years of monitoring, the vegetation in the channel has not caused any problems such as redirecting flows into streambanks and causing erosion. Overall the channel vegetation has increased the stability of the system and is typical of small stream swamp vegetative communities, which is the target vegetative community for the site.

The wetland continues to show high survivability and vigorous growth of the planted trees.

Some scattered populations of invasive species have been identified in the floodplain area, which include: Chinese lespedeza (*Lespedeza cuneata*) and tropical soda apple (*Solanum viarum*). Asian dayflower was present within the channel in isolated areas. Japanese honeysuckle (*Lonicera japonica*) was observed on the outer edges of the project. Although they are not a problem at this time, these populations will continue to be monitored to determine if invasive control is required in the future.

The monitored vegetation plots within the stream buffer and wetland revealed that the planted vegetation is growing well with 573 and 517 stems/acre, respectively. Only a few monitoring plots have low stem counts. The overall vegetation assessment found the site to be on track to meeting the vegetative success criteria.

The vegetative monitoring results are displayed in Appendix A and in the Current Condition Plan View.

### **2.2 Stream Assessment**

During the 2011 growing season, the stream experienced low flows, which is typical of the summer months. The on-site stream gauge recorded seven bankfull events in June, July, August, and November 2011.

The stream assessment found the stream to be generally stable, with no significant changes from the previous monitoring year. Periodic storm events caused isolated bed degradation in reaches 1 and 2. Some of these areas are visible on the longitudinal profile and cross-section plots. These patterns are typical for a stream like UT to Swift Creek. Its sand bed system is much more mobile than a gravel stream. Because of this, it is expected that patterns of aggradation and degradation are more dynamic within these systems. These dune/anti-dune streams will experience bed variation over time. The stream banks and floodplain experienced little to no erosion throughout the project. The in-stream structures are performing as designed. The water quality treatment areas are stable and retaining water. All of these stream features will continue to be monitored to make sure that any observed changes are within the range of variability found in stable stream systems.

The stream assessment monitoring is described in Appendix B and the Current Conditions Plan View.

## 2.3 Wetland Assessment

The maximum number of consecutive days that the groundwater was within 12 inches of the surface was determined for each groundwater gauge. This number was converted into a percentage of the 223-day growing season. Table 5 presents the hydrological monitoring results for 2011. The wetland wells used to monitor site hydrology were installed in the spring of 2007. During the fourth year of monitoring wetland hydrology was achieved at all of the wells on the site (Table 5). Based on these data, the site has exceeded the minimum duration of 12 consecutive days with the water table within 12 inches of the soil surface for the 2011 growing season (Appendix B). Climatic data for the 2011 growing season were analyzed in comparison to historical data to determine whether 2011 was a normal year in terms of climatic conditions. The historical data were collected from the NRCS, Water and Climate Center, “Climate Analysis for Wetlands by County” website. This evaluation concluded that 2011 was an average to below average year for rainfall during the growing season. Rainfall was within the 30<sup>th</sup> to 70<sup>th</sup> percentiles for the months of March, May, July, September, and October. Rainfall was less than the 30<sup>th</sup> percentile threshold in January, February, April, June and November, and was greater than the 70<sup>th</sup> percentile threshold in August. (Appendix B).

### 2.3.1 Wetland Criteria Attainment Tables

**Table VIIIa. Hydrologic Monitoring Results**

**Project Name: Harrell Stream and Wetland Restoration**

Well #	Hydroperiod						Max. No. of Consecutive Days	Dates Meeting Success
	<5%	5% - 8%	8% - 12.5%	>12.5%	Actual %			
1			X		9.4%	21	3/30-4/20	
2				X	18.8%	42	3/20-5/1	
3		X			7.2%	16	8/27-9/11	
4		X			7.2%	16	3/30-4/15	

**Table VIIIb. Hydroperiod History**

**Harrell Stream and Wetland Restoration**

Well #	Pre-Restoration	Year 1	Year 2	Year 3	Year 4	Year 5
1	<5%	6.8%	9.8%	8.1%	9.4%	
2	<5%	16.5%	12.4%	9.4%	18.8%	
3	<5%	6.8%	9.8%	8.5%	7.2%	
4	<5%	13.7%	12.0%	8.5%	7.2%	

## 3.0 SUCCESS CRITERIA

The stream is functioning as designed and has not developed any significant problems. The changes that are visible in the monitored cross-sections and profiles indicate adjustment of the stream due to its sand bed. Any feature changes will be tracked to see if the stream is moving beyond its expected variability. With multiple bankfull events since construction, the stream is on track to meeting the success criterion of at least two bankfull events occurring in separate years over the course of the monitoring period.

The hydrology data in Section 2.3 indicates that the wetland is on track to meeting the success criterion of having the groundwater continuously within 12" of the ground surface for 5% of the growing season.

The planted vegetation has been doing well, with some plots experiencing more mortality than others. This mortality can be attributed to normal losses after the initial planting as well as to the effects of a drought soon after planting. The low planted stem density areas on the stream floodplain are mostly caused by the poor soil quality in these areas and periods of flooding in the lower stream reaches. The

supplemental planting over the past years has increased the number of woody stems in these areas. Some invasive species have been identified on the site, which include Chinese lespedeza (*Lespedeza cuneata*), Japanese honeysuckle (*Lonicera japonica*), tropical soda apple (*Solanum viarum*) and Asian dayflower (*Murdannia keisak*). The exotic vegetation is not widespread across the project, but these populations will continue to be monitored to determine if control measures will be required in the future. The vegetation is on track to meeting the success criteria in the steam and wetland for the fourth year of monitoring.

## **Appendix C4 – Stream and Wetland Hydrographs**

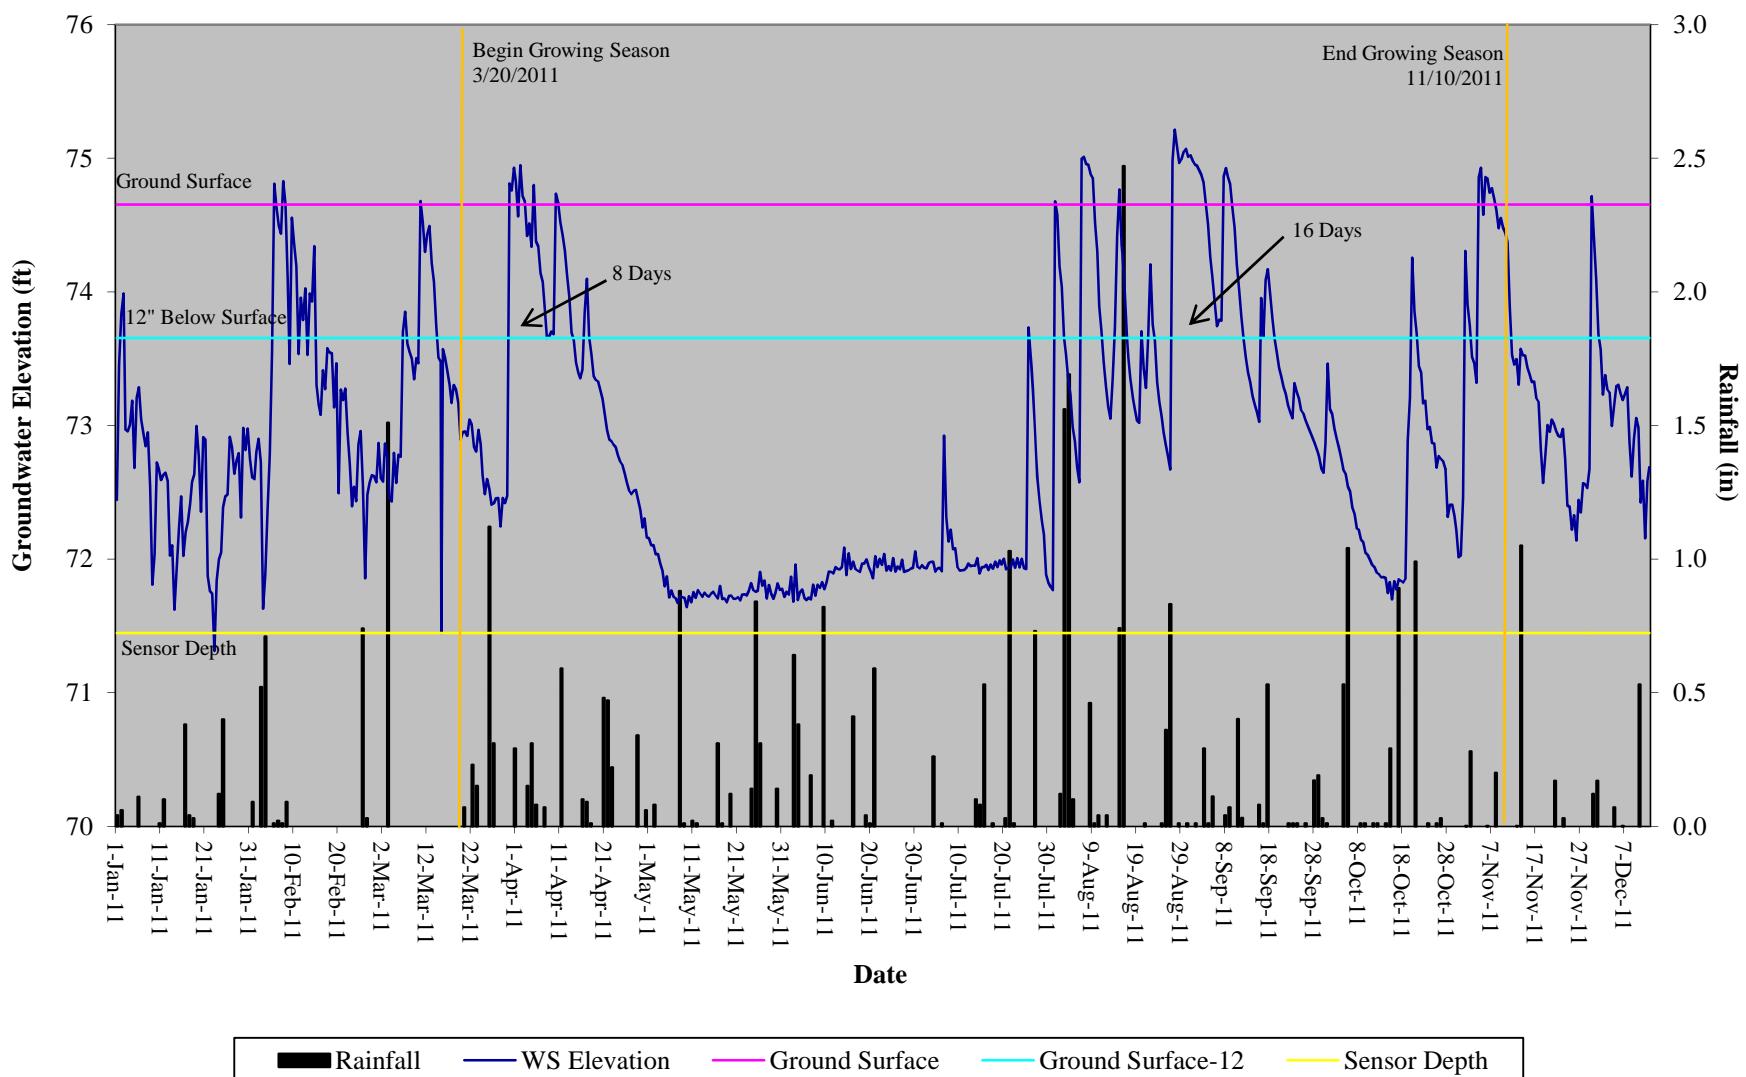

**Harrell Farm Gauge 1 Wetland Hydrograph**  
**1/1/11 to 12/13/11**

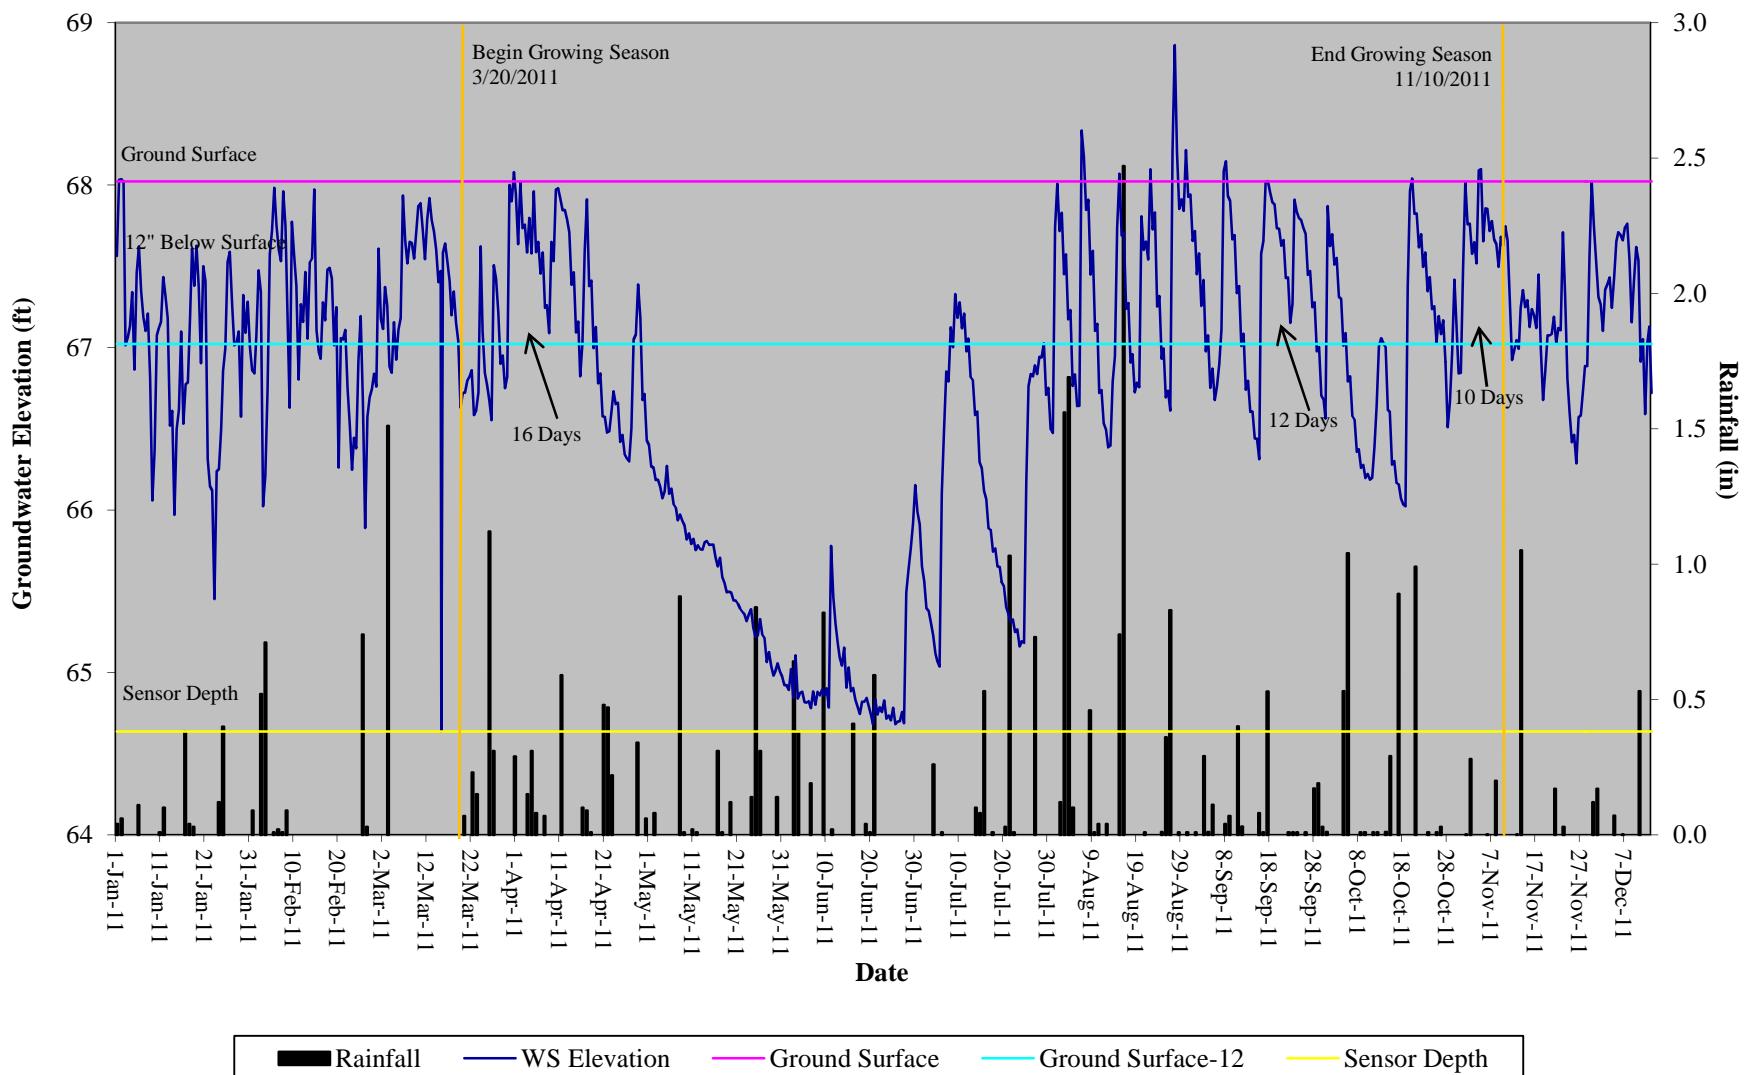

**Harrell Farm Gauge 2 Wetland Hydrograph**  
**1/1/11 to 12/13/11**

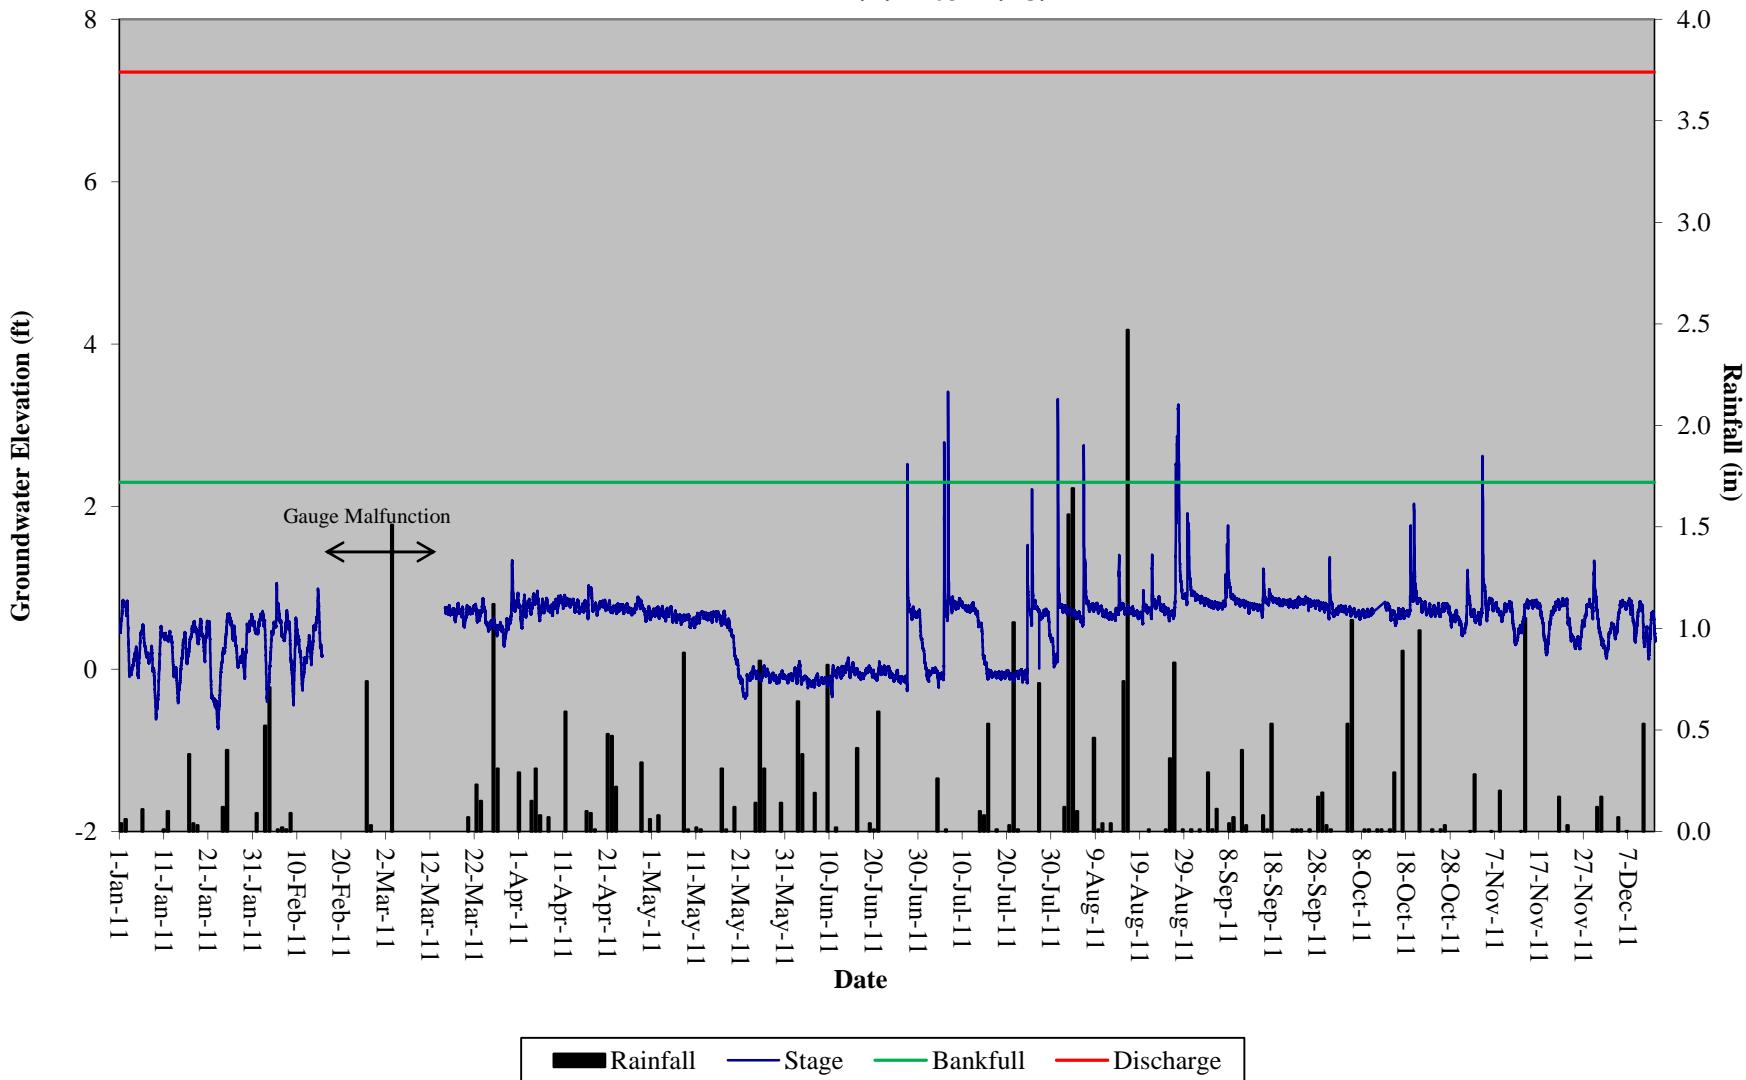

**Harrell Farm Gauge 3 Wetland Hydrograph**  
**1/1/11 to 12/13/11**

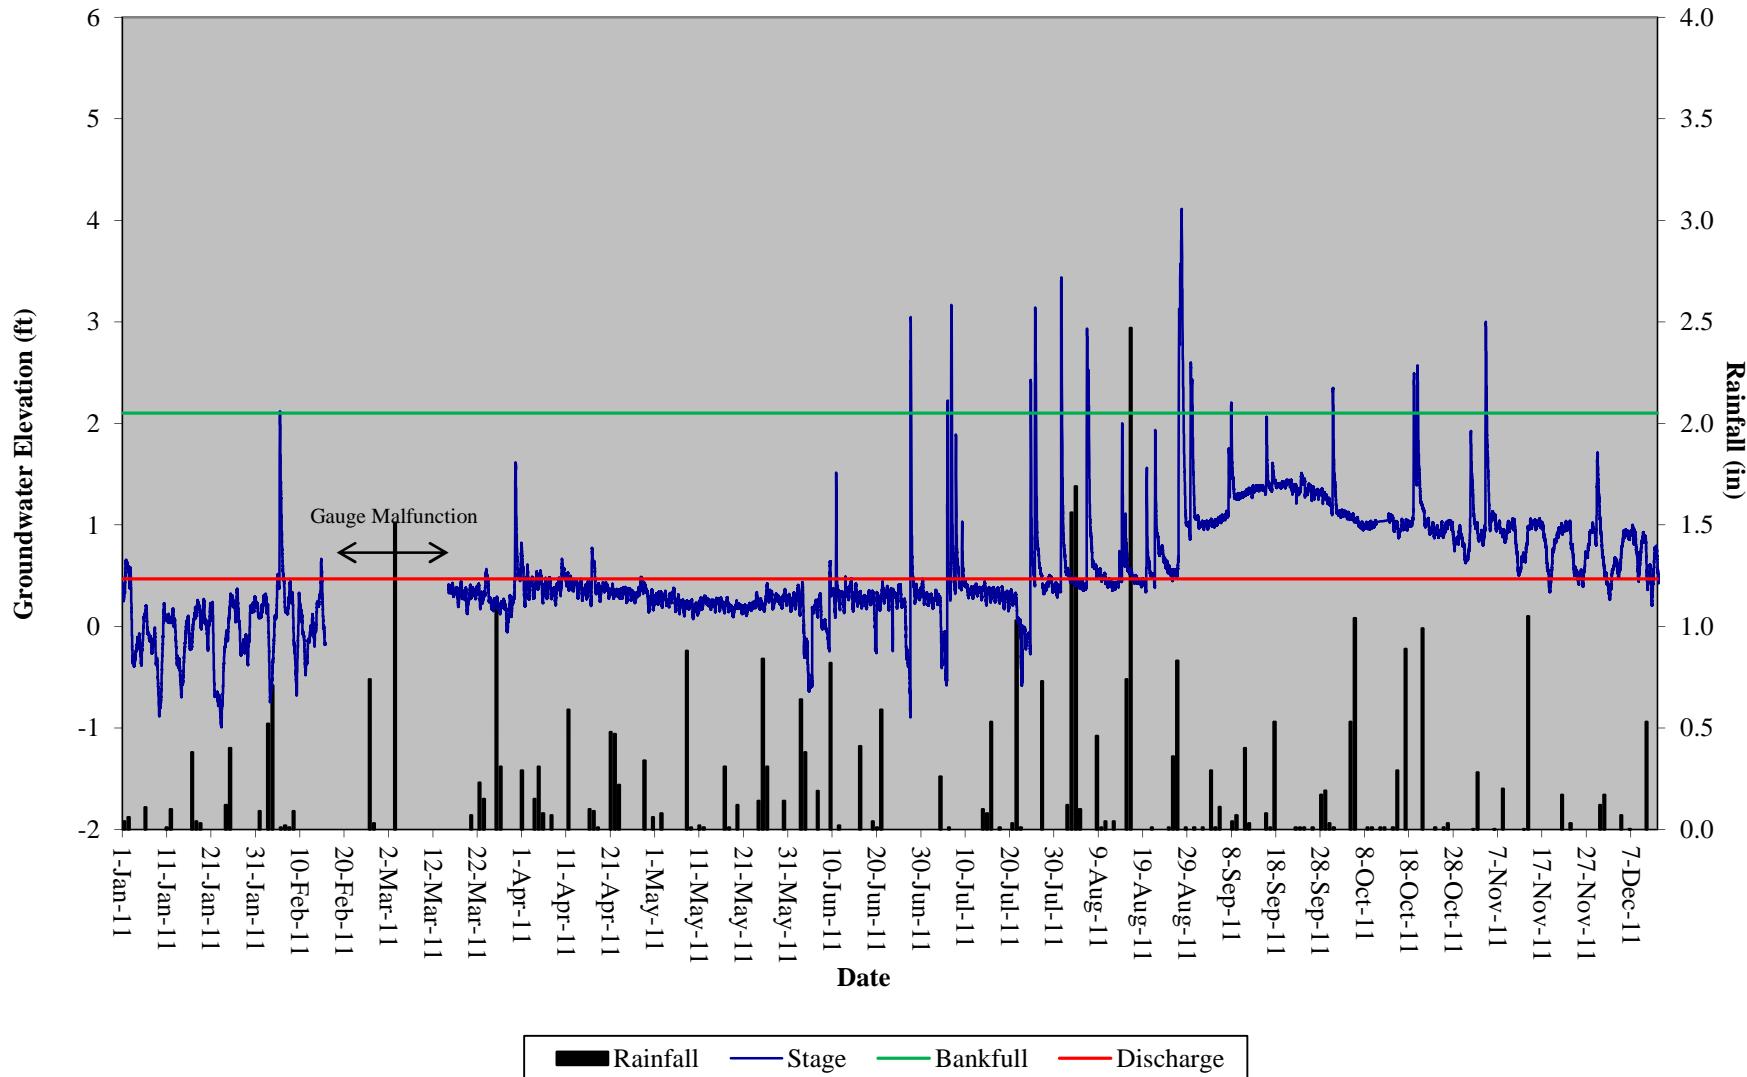

**Harrell Farm Gauge 4 Wetland Hydrograph**  
**1/1/11 to 12/13/11**

**Harrell Stream and Wetland Restoration**  
**Stream Gauge 1 Hydrograph**  
**1/1/11 to 12/13/11**

**Harrell Stream and Wetland Restoration**  
**Stream Gauge 2 Hydrograph**  
**1/1/11 to 12/13/11**

## **Appendix C5 – Precipitation 30-70 Percentile Graph**

**Harrell 30-70 Percentile Graph 2010-2011**  
**Rocky Mount, NC Monthly Rainfall**
