RE: Final Monitoring Report (MY7) / Closeout Report – Final Submittal
Hopewell Stream Mitigation Site
DMS Project No. 95352
DEQ Contract No. 004642

Dear Mr. Tsomides:

Wildlands Engineering, Inc. (Wildlands) has reviewed the Division of Mitigation Services' (DMS) comments from the Draft Monitoring Year (MY) 7 / Closeout Report for the Hopewell Stream Mitigation Site. The following Wildlands' responses to DMS' report comments are noted in italic lettering.

DMS' comment: For clarity, please provide an overall assets summary table as follows:

Overall Assets Summary

Asset Category	Overall Credits
Stream (warm)	**7,412.133**
Wetland	**NA**

Wildlands' Response: An overall assets summary table has been added to Appendix 1 (Table 1B).

DMS' comment: In Appendix 7 please provide a map showing the sweetgum-treated area and include a table indicating quantities and species planted.

Wildlands' Response: A map depicting the sweetgum treatment area has been inserted into Appendix 7. A table with species, container size, and quantities for the supplemental plantings in the sweetgum treatment area and captured easement along UT1B R1 has been to Appendix 7. The table was inadvertently left out of the MY7 draft submittal.

DMS' comment: Please follow up and respond via email to the miscellaneous minor property close out issues sent via email on 11/8/2021, following that field visit.

Wildlands' Response: Wildlands responded to Harry Tsomides, DMS PM, via email on 1/5/2021 regarding the miscellaneous items including boundary marking and debris removal.

DMS' Digital File Comment: Please address the minor issues (scattered invasives, loose fencing etc.) identified with DMS during the 12/8/2021 site meeting and follow up with me prior to close out).

Wildlands' Response: Wildlands will address the minor issues in January 2022 and notify DMS when work is complete.

Two (2) hard copies of the Final Monitoring Report (MY7) / Closeout Report and a full electronic submittal has been mailed to the DMS Western Field Office. Please contact me at 704-332-7754 x110 if you have any questions.

Sincerely,

Kristi Suggs
Senior Environmental Scientist
ksuggs@wildlandseng.com

EXECUTIVE SUMMARY

Wildlands Engineering, Inc. (Wildlands) completed a full delivery project at the Hopewell Mitigation Site (Site) for the North Carolina Division of Mitigation Services (DMS) to restore, enhance, and preserve a total of 12,308 linear feet (LF) of perennial and intermittent streams in Randolph County, NC. The Site is expected to generate 7,412.133 stream mitigation units (SMUs) by closeout. The Site is located near the town of Asheboro in the Yadkin-Pee Dee River Basin. The eight-digit Cataloging Unit (CU) is 03040104 and the 14-digit Hydrologic Unit Code (HUC) is 03040104030010 (Figure 1). The project streams consist of the Little River and five unnamed tributaries (UTs) to the Little River (Figure 2). The Little River eventually flows into the Pee Dee River near the town of Ingram in Richmond County, while the five unnamed streams are small headwater tributaries to the Little River. The project watershed consists primarily of pastureland and forest.

The Site is in the Little River watershed, which was designated as a Targeted Local Watershed (TLW) in the 2009 Lower Yadkin Pee-Dee River Basin Restoration Priorities (RBRP) plan. The RBRP plan does not specifically identify stressors or project goals in this TLW, but states that continuing watershed improvements will increase ecological uplift. The intent of this project is to help meet the goals for the watershed outlined in the RBRP and provide numerous ecological benefits within the Yadkin-Pee Dee River Basin.

The project goals established in the Mitigation Plan (Wildlands, 2013) were established with careful consideration of goals and objectives that were described in the RBRP and to meet DMS mitigation needs while maximizing the ecological and water quality uplift within the watershed. The following project goals established include:

- Restoring a degraded stream impacted by cattle to create and improve aquatic habitat, reduce sediment inputs from streambank erosion, and reduce agricultural runoff pollution; and
- Restoring a riparian buffer along stream corridors for additional terrestrial and aquatic habitat, nutrient input reduction, and water quality benefits.

The Site construction, planting, and as-built surveys were completed between July 2014 and January 2015. Annual monitoring activities have been conducted since 2015 with an anticipated closeout date in 2022. A conservation easement is in place on 35.4 acres of the riparian corridors to protect them in perpetuity.

This is the seventh and final monitoring report (MY7) as established in the in the Mitigation Plan (Wildlands, 2013) and will also serve as the closeout report. The Site has met the required geomorphic, vegetation, and hydrologic success criteria for the seven years of post-construction monitoring. Geomorphically, each restored and enhanced stream has remained stable with cross-sectional dimensions falling within the range of parameters for the appropriate Rosgen stream type (Rosgen, 1996). Visual stream assessments indicate channel bed, banks, and engineered structures are functioning as designed with little to no instability. The overall average stem density for the Site is 423 stems per acre which exceeds the final density criteria of 210 stems per acres. Hydrological success criteria in the form of two or more bankfull events occurring within separate years has been documented at all stream gages.

TABLE OF CONTENTS

APPENDICES

Section 1: PROJECT OVERVIEW

The Site is in central Randolph County within the Yadkin-Pee Dee River Basin (USGS Hydrologic Unit 03040104) near the town of Asheboro, North Carolina. The Site is located along Hopewell Friends Road, Mack Road, and Pisgah Covered Bridge Road, just west of Interstate 74/73. The Site is in in the Carolina Slate Belt of the Piedmont Physiographic Province (USGS, 1998). The project watershed consists primarily of agricultural and wooded land. The only significant development in the watershed is within the northern extent which includes portions of the City of Asheboro. The drainage area for the western portion of the project site is 429 acres (0.67 square miles). The drainage area for the eastern portion of the project site, which includes a reach on the Little River, is 4,517 acres (7.06 square miles).

The project streams consist of the Little River and five unnamed tributaries (UTs) to the Little River. Mitigation work within the Site included restoration, enhancement, and preservation of 12,308 linear feet (LF) of perennial and intermittent stream channel. Stream restoration reaches include UT2 Reach 1 and 2, UT2A Reach 2, UT2B Reach 2, and UT2C Reach 2 and 3. Stream enhancement I (EI) include UT1B Reach 1 and UT2A Reach 1. Stream enhancement II (EII) reaches include Little River Reach 2, UT1A Reach 1, UT1B Reach 2 and 3, UT2B Reach 1, and UT2C Reach 1. Preservation reaches on the Site include Little River Reach 1 and UT1A Reach 2.

The riparian areas were planted with native vegetation to improve habitat and protect water quality. Construction activities were completed by Terry's Plumbing and Land Mechanics Designs, Inc. in November 2014. Planting and seeding activities were completed by Bruton Natural Systems, Inc., and Terry's Plumbing in January 2015. A conservation easement has been recorded and is in place along the stream riparian corridors to protect them in perpetuity. Baseline monitoring (MY0) was conducted between December 2014 and January 2015. Annual monitoring was conducted for seven years, and now that success criteria have been met, close out is anticipated to commence in 2022. The conservation easement includes 35.954 acres (Deed Book 2371, Page 108-122) within a tract owned by Double T Farms of Randolph, LLC. The project provides 7,412.133 stream mitigation units (SMU's). Appendix 1 provides more detailed project activity, history, contact information, and watershed/site background information for this project.

Directions and a map of the Site are provided in Figure 1 and project components are illustrated for the Site in Figure 2.

1.1 Project Goals and Objectives

Prior to construction activities, many of the streams on the Site, especially those that were accessed less by cattle, exhibited relative stability. However, other project reaches appeared incised and had been severely trampled by cattle resulting in unstable banks, and the bed morphologies were often destroyed. Table 4 in Appendix 1 and Tables 10a through 10d in Appendix 4 present the pre-restoration conditions in detail.

The Site will help meet the goals for the watershed outlined in the RBRP and provide numerous ecological benefits within the Yadkin-Pee Dee River Basin. While many of these benefits are limited to the Hopewell project area, others, such as pollutant removal, reduced sediment loading, and improved aquatic and terrestrial habitat, have a more extensive impact. Expected improvements to water quality and ecological processes are outlined below as project goals and objectives. These project goals were established with careful consideration of goals and objectives that were described in the RBRP and to meet DMS mitigation needs while maximizing the ecological and water quality uplift within the watershed.

The RBRP describes the goals for the 8-digit HUC as the following:

- Continuation of watershed improvement efforts already on-going,
- Protection of valuable natural resources, and
- Development of local partnerships that will work together to implement management strategies for stormwater impacts.

The following project-specific goals were established in the Mitigation Plan (Wildlands, 2013) to contribute to meeting management goals as described above for the Yadkin-Pee Dee Catalog Unit 03040104 and the Little River Target Local Watershed (TLW):

- Restoring a degraded stream impacted by cattle to create and improve aquatic habitat, reduce sediment inputs from streambank erosion, and reduce agricultural runoff pollution; and
- Restoring a riparian buffer along stream corridors for additional terrestrial and aquatic habitat, nutrient input reduction, and water quality benefits.

The project goals were addressed through the following project objectives as stated in the Mitigation Plan:

- On-site nutrient inputs will be decreased by removing cattle from streams and filtering on-site runoff through buffer zones. Off-site nutrient inputs will be absorbed on-site by filtering flood flows through restored floodplain areas, where flood flow will spread through native vegetation;
- Restored buffers and exclusion of livestock to streams will significantly reduce inputs of livestock wastes to streams. This will eliminate a major source of fecal coliform pollution;
- Streambank erosion which contributes sediment load to the creek will be greatly reduced, if not eliminated, in the project area. Eroding stream banks will be stabilized using bioengineering, natural channel design techniques, and grading to reduce bank angles and bank height. Storm flow containing fine sediment will be filtered through restored floodplain areas, where flow will spread through native vegetation. Spreading flood flows will also reduce stream velocity and allow sediment to settle out. Sediment transport capacity of restored reaches will be improved so that capacity balances more closely with load;
- Restored riffle/pool sequences will promote aeration of water and create deep water zones, helping to lower water temperature. Establishment and maintenance of riparian buffers will create long-term shading of the channel to minimize thermal heating. Lower water temperatures will help maintain dissolved oxygen concentrations;
- In-stream structures will be constructed to improve habitat diversity and trap detritus. Wood habitat structures will be included in the stream as part of the restoration design. Such structures may include log drops and riffle structures that incorporate woody debris;
- Adjacent buffer and riparian habitats will be restored with native vegetation as part of the project. Native vegetation will provide cover and food for terrestrial wildlife. Native plant species will be planted and invasive species will be treated. Eroding and unstable areas will also be stabilized with vegetation as part of this project; and
- The restored land will be protected in perpetuity through a conservation easement.

The design streams were restored to the appropriate type based on the surrounding landscape, climate, and natural vegetation communities, but also with strong consideration to existing watershed conditions and trajectory.

1.2 Monitoring Year 7 Data Assessment

Annual monitoring and site visits were conducted during MY7 to assess the condition of the project. The stream and vegetation success criteria for the Site follows the approved success criteria presented in the

Hopewell Stream Mitigation Plan (Wildlands, 2013). The MY7 vegetation and stream surveys were completed in September 2021.

1.2.1 Vegetative Assessment

A total of 31 vegetation plots were established during baseline monitoring within the project easement areas. All of the plots were installed using a standard 10 meter by 10 meter plot. The final vegetative success criteria will be the survival of 210 planted stems per acre in the riparian corridor along restored and enhanced reaches at the end of the MY7. Planted vegetation must average 10 feet in height in each plot at the end of the seventh year of monitoring.

In MY7, all vegetation plots exceeded the final stem density success criteria (210 stems/acre) for planted stems. Individual plot density ranged between 243 stems/acre to 607 stems/acre with an overall average stem density of 423 stems/acre. Stem heights averaged 17.2 feet in MY7 which is a 29% increase in height compared to the MY6 stem height average of 13.4 feet. Most vegetation plots (26 of 31) exceed the final average stem height requirement of 10 feet at the end of MY7. Five plots have average stem heights slightly below the final success criteria and range from 7.7 to 9.0 feet. Most planted woody stems (94%) within the plots had a vigor rating of 3 or more. Refer to Appendix 2 for vegetation plot photographs and the vegetation condition assessment table, and Appendix 3 for vegetation data tables.

Significant efforts were implemented during construction to control the invasive species within the Site, and follow up treatments have continued throughout the seven years of post-construction monitoring. Invasive species treatments have primarily focused on Chinese privet (*Lingustrum sinese*) and to a lesser extent, tree of heaven (*Ailanthus altissima*). Based on visual assessments, treatments have reduced invasive species from approximately 23% of the overall easement acreage in MY1 to less than 1% in MY6 and MY7. During September 2021, small pockets of Chinese privet and tree of heaven (*Ailanthus altissima*) were treated across the site.

Pockets of dense sweetgum (*Liquidambar styraciflua*) volunteers were treated in late 2019 and early 2020 in the upper section of UT1B Reach 1 and UT2C Reach 2. In February 2020, 75 containerized trees were planted in the larger sweetgum treatment area on UT1B Reach 1 as discussed during the IRT/DMS site meeting in May 2019. A follow up sweetgum treatment was performed in September 2021 to areas with resprouts on the upper section of UT1B Reach 1. Refer to Appendix 6 for IRT/DMS meeting minutes and Appendix 7 for photographs of sweetgum treatment and containerized tree planting areas taken in May 2020. Refer to Appendix 2 for the vegetation condition assessment table and the Integrated Current Condition Plan View (CCPV) Maps.

A small portion of fencing along UT1B Reach 1 that deviated from the conservation easement was realigned to match the easement boundary during MY6. Thirty containerized trees were planted within the newly captured easement area in April 2020. Refer to Appendix 6 for list of the types and number of planted trees, as well as their container size, and Appendix 7 for photographic documentation of MY6 plantings taken in May 2020.

1.2.2 Stream Assessment

All streams within the Site appear stable and have met the final geomorphic success criteria. Riffle cross-sections generally show little change in the bankfull area, maximum depth ratio, and width-to-depth ratio and fell within the appropriate Rosgen stream type parameters (Rosgen, 1996). Minor channel adjustments documented during MY7 include deposition at cross-sections 1 (UT2A Reach 1), cross-sections 14 and 15 (UT1B), and cross-sections 16 and 17 (UT2C). Subtle cross-section changes are expected and do not indicate instability. No instability was observed during MY7 field assessments.

In-stream structures used to restore and enhance channel habitat and stability are functioning as designed. Per the Mitigation Plan (Wildlands 2013), pattern data would only be completed if annual monitoring data indicated vertical and lateral instability. No changes were observed in pattern data (radius of curvature or channel belt width); therefore, no pattern data was collected in MY7.

In general, substrate materials in the restoration and enhancement reaches indicated coarser materials in the riffles and finer particles in the pools and distributions are indicative of cyclic changes in sediment transport.

Refer to Appendix 2 for the visual stability assessment table, CCPV maps, and reference photographs. Refer to Appendix 4 for the morphological data and plots.

1.2.3 Areas of Concern/Adaptive Management Plan

Wildlands will continue to monitor and implement invasive treatments through closeout to reduce and control the extent of invasive species at the Site.

1.2.4 Hydrology Assessment

At the end of the seven-year monitoring period, two or more bankfull events must have occurred in separate years within the restoration and enhancement reaches. The hydrology success criteria were met for the seven-year monitoring period after MY2. During MY7, bankfull events were recorded on all automated gages except for UT2B Reach 2; however, evidence of a bankfull event was recorded with the use of the manual crest gage on this reach. Refer to Appendix 5 for hydrologic data.

1.3 Monitoring Year 7 Summary

Overall, the Site has met the final geomorphic, vegetation, and hydrologic success criteria. Stream surveys indicate the channel dimensions are stable and functioning as designed. Visual assessments reveal little to no signs of instability within bed, bank, or engineered structures. The average planted stem density for the Site (423 stems per acre) exceeds the final MY7 success density criteria (210 stems per acre). Most vegetation plots (26 of 31) exceed the average stem height per plot success criteria of 10 feet. The five plots below the threshold are trending towards the 10-foot criteria. Multiple bankfull events have been documented at all stream gages across the Site in separate monitoring years which satisfies the final hydrology success criteria. MY7 is the final year of monitoring, and the Site will be presented to the IRT for regulatory closeout in 2022.

Summary information and data related to the performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the Mitigation Plan documents available on DMS's website. All raw data supporting the tables and figures in the appendices are available from DMS upon request.

Section 2: METHODOLOGY

Geomorphic data were collected following the standards outlined in The Stream Channel Reference Site: An Illustrated Guide to Field Techniques (Harrelson et al., 1994) and in the Stream Restoration: A Natural Channel Design Handbook (Doll et al., 2003). All Integrated Current Condition Mapping was recorded using a Trimble handheld GPS with sub-meter accuracy and processed using Pathfinder and ArcGIS. Crest gages and pressure transducers were installed in surveyed riffle cross sections and monitored quarterly to document bankfull events. Hydrologic monitoring instrument installation and monitoring methods are in accordance with the United States Army Corps of Engineers (USACE, 2003) standards. Vegetation monitoring protocols followed the Carolina Vegetation Survey-EEP Level 2 Protocol (Lee et al., 2008).

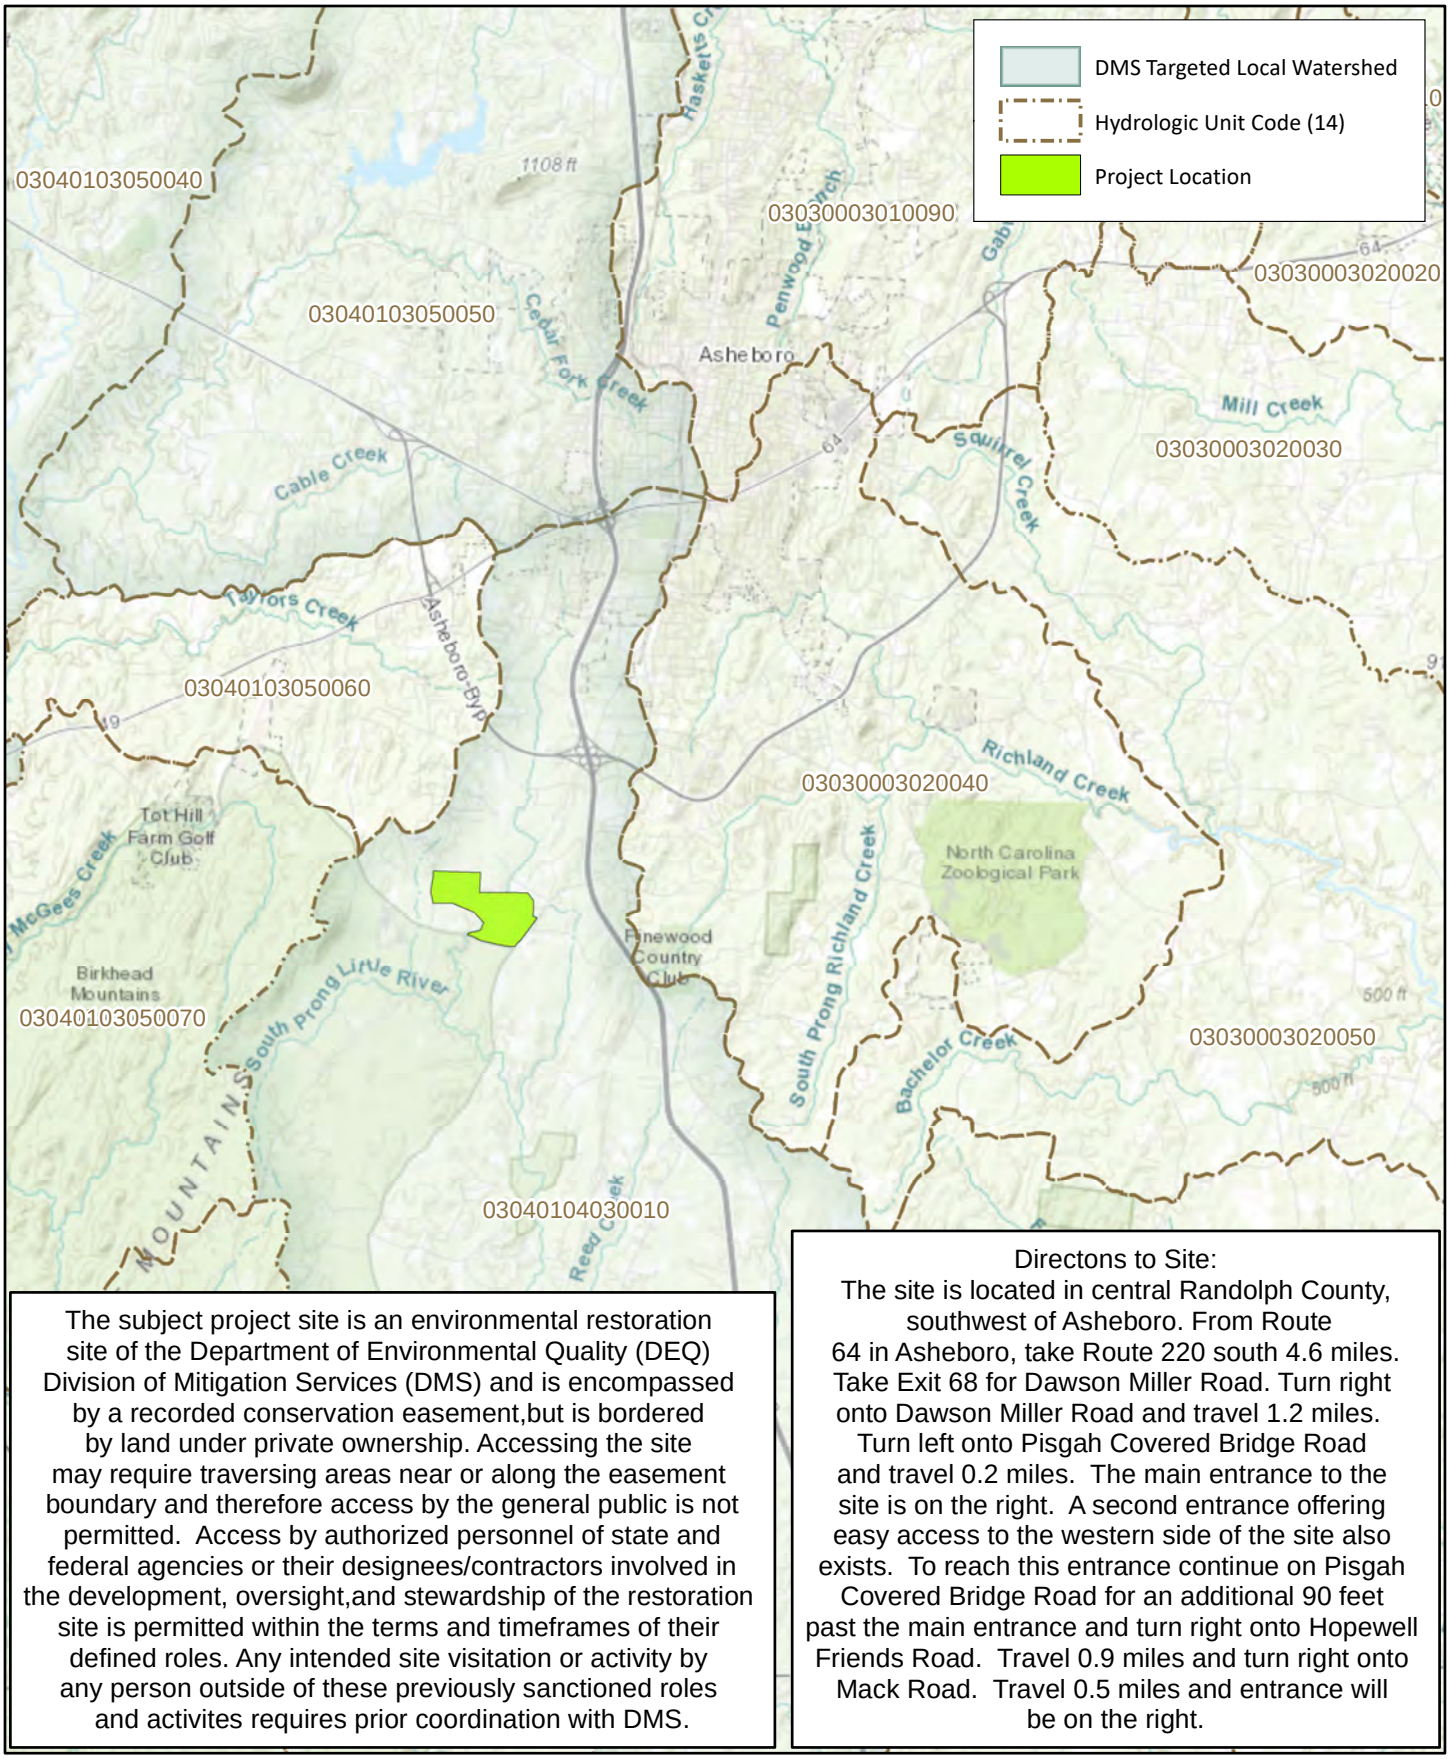
APPENDIX 1. General Figures and Tables



The subject project site is an environmental restoration site of the Department of Environmental Quality (DEQ) Division of Mitigation Services (DMS) and is encompassed by a recorded conservation easement,but is bordered by land under private ownership. Accessing the site may require traversing areas near or along the easement boundary and therefore access by the general public is not permitted. Access by authorized personnel of state and federal agencies or their designees/contractors involved in the development, oversight,and stewardship of the restoration site is permitted within the terms and timeframes of their defined roles. Any intended site visitation or activity by any person outside of these previously sanctioned roles and activites requires prior coordination with DMS.

Directons to Site:
The site is located in central Randolph County, southwest of Asheboro. From Route 64 in Asheboro, take Route 220 south 4.6 miles. Take Exit 68 for Dawson Miller Road. Turn right onto Dawson Miller Road and travel 1.2 miles. Turn left onto Pisgah Covered Bridge Road and travel 0.2 miles. The main entrance to the site is on the right. A second entrance offering easy access to the western side of the site also exists. To reach this entrance continue on Pisgah Covered Bridge Road for an additional 90 feet past the main entrance and turn right onto Hopewell Friends Road. Travel 0.9 miles and turn right onto Mack Road. Travel 0.5 miles and entrance will be on the right.

Table 4. Project Information and Attributes
Hopewell Stream Mitigation Site
DMS Project No. 95352
Monitoring Year 7 - 2021

Project Information	
Project Name	Hopewell Stream Mitigation Site
County	Randolph county
Project Area (acres)	35.4
Project Coordinates (latitude and longitude)	35°37'37.32" N, 79° 51'13.27" W
Project Watershed Summary Information	
Physiographic Province	Carolina Slate Belt of the Piedmont Physiographic Province
River Basin	Yadkin-Pee Dee
USGS Hydrologic Unit 8-digit	03040104
USGS Hydrologic Unit 14-digit	03040104030010
DWR Sub-basin	03-07-15
Project Drainiage Area (acres)	4,083
Project Drainage Area Percentage of Impervious Area	2%
CGIA Land Use Classification	2.01.03 – Hay and Pasture Land; 2.99.05 - Farm Ponds; 4 – Forest Land; 1 - Urban and Developed Land

Reach Summary Information

Parameters	Little River	UT1A	UT1B Reach 1	UT1B Reach 2 & 3	UT2 Reach 1	UT2 Reach 2	UT2A Reach 1	UT2A Reach 2	UT2B	UT2C
Length of reach (linear feet) - Post-Restoration	3,911	597	480	575	1,547	681	386	1,364	1,046	247
Drainage area (acres)	4,083	38	19	45	246	378	64	102	22	51
NCDWR stream identification score	43.5	22.5	24.5	30	35.5	35.5	27	35	23.7	31
NCDWR Water Quality Classification	C									
Morphological Desription (stream type)	P	I	I	P	P	P	I	P	I	P
Evolutionary trend (Simon's Model) - Pre- Restoration	I/II	I	III	I	III/IV	IV	III	III/IV	III	III
Underlying mapped soils	Badin-Tarrus Complex, Chewacla Loam, Georgeville silt loam, Georgeville silty clay loam, Mecklenburg clay loam, Riverview sandy loam									
Drainage class	---	---	---	---	---	---	---	---	---	---
Soil hydric status	---	---	---	---	---	---	---	---	---	---
Slope	0.0051	0.0389	0.03	0.0583	0.0093	0.0075	0.0102	0.011	0.0259	0.0154
FEMA classification	AE*									
Native vegetation community	Piedmont Bottomland Forest / Mixed Mesic Hardwood Forest									
Percent composition exotic invasive vegetation-Post-Restoration	0%									

Regulatory Considerations

Regulation	Applicable?	Resolved?	Supporting Documentation
Waters of the United States - Section 404	X	X	USACE Nationwide Permit No.27 and DWQ 401 Water Quality Certification No. 3885.
Waters of the United States - Section 401	X	X	
Division of Land Quality (Dam Safety)	N/A	N/A	N/A
Endangered Species Act	X	X	Hopewell Mitigation Plan; Wildlands determined "no effect" on Randolph County listed endangered species. (Letter from USFWS dated July 27, 2012)
Historic Preservation Act	X	X	No historic resources were found to be impacted (letter from SHPO dated 7/13/2012).
Coastal Zone Management Act (CZMA)/Coastal Area Management Act (CAMA)	N/A	N/A	N/A
FEMA Floodplain Compliance	X	X	Little River is a mapped Zone AE floodplain with defined base flood elevations. A floodway has not been delineated but non-encroachment widths have been defined; (FEMA Zone AE, FIRM panel 7648).
Essential Fisheries Habitat	N/A	N/A	N/A

Table 6. Vegetation Condition Assessment Table Hopewell Stream Mitigation Site
DMS Project No. 95352
Monitoring Year 7 - 2021 / Assessment Dates 9/27 -9/30/2021

Planted Acreage **24**

Vegetation Category	Definitions	Mapping Threshold (Ac)	Number of Polygons	Combined Acreage	% of Planted Acreage
Bare Areas	Very limited cover of both woody and herbaceous material	0.1	0	0	0.0%
Low Stem Density Areas	Woody stem densities clearly below target levels based on MY3, 4, or 5 stem count criteria.	0.1	0	0.0	0.0%
		Total	**0**	**0.0**	**0.0%**
Areas of Poor Growth Rates or Vigor	Areas with woody stems of a size class that are obviously small given the monitoring year.	0.25 Ac	0	0	0%
		Cumulative Total	**0**	**0.0**	**0.0%**

Easement Acreage **35**

Vegetation Category	Definitions	Mapping Threshold (SF)	Number of Polygons	Combined Acreage	% of Easement Acreage
Invasive Areas of Concern	Areas of points (if too small to render as polygons at map scale).	1,000	4	0.14	0.4%
Easement Encroachment Areas	Areas of points (if too small to render as polygons at map scale).	none	0	0	0%

Hopewell Stream Mitigation Site

DMS Project No. 95352

Monitoring Year 7 - 2021

Report Prepared By	Ian Eckardt
Date Prepared	11/16/2021 17:54
Database Name	cvs-eep-entrytool-v2.5.0 Hopewell MY7.mdb
Database Location	\\192.168.3.7\projects\ActiveProjects\005-02133 Hopewell Mitigation FDP\Monitoring\Monitoring Year 7 (2021)\Vegetation Assessment
Computer Name	IAN
File Size	53575680
DESCRIPTION OF WORKSHEETS IN THIS DOCUMENT----------	
Metadata	Description of database file, the report worksheets, and a summary of project(s) and project data.
Project Planted	Each project is listed with its PLANTED stems per acre, for each year. This excludes live stakes.
Project Total Stems	Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems.
Plots	List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.).
Vigor	Frequency distribution of vigor classes for stems for all plots.
Vigor by Spp	Frequency distribution of vigor classes listed by species.
Damage	List of most frequent damage classes with number of occurrences and percent of total stems impacted by each.
Damage by Spp	Damage values tallied by type for each species.
Damage by Plot	Damage values tallied by type for each plot.
Planted Stems by Plot and Spp	A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded.
ALL Stems by Plot and Spp	A matrix of the count of total living stems of each species (planted and natural volunteers combined) for each plot; dead and missing stems are excluded.
PROJECT SUMMARY----------	
Project Code	95352
Project Name	Hopewell Stream Mitigation Site
Area (sq m)	128285.35
Required Plots (calculated)	22
Sampled Plots	31

[1] Prior to MY4, bankfull dimensions were calculated using a fixed baseline bankfull elevation.

[2] MY4-MY7 Bank Height Ratio are calculated based on the As-built (MY0) cross-sectional area as described in the Standard Measurement of the BHR Monitoring Parameter document provided by the NCIRT (9/2018). The remainder of the cross-section dimension parameters were calculated based on the current year's low bank height.

[3] Bankfull elevation was set too high on Cross-Section 7 between MY0 and MY3 which resulted in a wider bankfull width in those years.

[4] Bankfull dimension calcuations were adjusted at Cross-Section 9 between MY0 and MY3 because the baseline bankfull elevation was set low and fell within the active channel.

[1] Prior to MY4, bankfull dimensions were calculated using a fixed baseline bankfull elevation.
[2] MY4-MY7 Bank Height Ratio are calculated based on the As-built (MY0) cross-sectional area as described in the Standard Measurement of the BHR Monitoring Parameter document provided by the NCIRT (9/2018). The remainder of the cross-section dimension parameters were calculated based on the current year's low bank height.

(---): Data was not provided

[1] Prior to MY4, bankfull dimensions were calculated using a fixed bankfull elevation

[2] MY4-MY7 Bank Height Ratio was calculated based on the As-built (MY0) cross-sectional area as described in the Standard Measurement of the BHR Monitoring Parameter document provided by the NCIRT (9/2018). The remainder of the cross-section dimension parameters were calculated based on the current year's low bank height.

[3] Reachwide sediment results were incorrectly reported in MY4. This data has been updated to reflect the correct results.

(---): Data was not provided

[1] Prior to MY4, bankfull dimensions were calculated using a fixed bankfull elevation

[2] MY4-MY7 Bank Height Ratio was calculated based on the As-built (MY0) cross-sectional area as described in the Standard Measurement of the BHR Monitoring Parameter document provided by the NCIRT (9/2018). The remainder of the cross-section dimension parameters were calculated based on the current year's low bank height.

[3] Reachwide sediment results were incorrectly reported in MY4. This data has been updated to reflect the correct results.

WILDLANDS
ENGINEERING

MEETING NOTES

MEETING: IRT MY4 Credit Release Site Walk
Hopewell Mitigation Site
Yadkin 03040104; Randolph County, NC
DEQ Contract No. 4642
DMS Project No. 95352
Wildlands Project No. 005-02133

DATE: Wednesday, May 29, 2019

LOCATION: Pisgah Covered Bridge Road
Asheboro, NC

Attendees

Todd Tugwell, USACE	Melonie Allen, DMS	Shawn Wilkerson, Wildlands
Kim Browning, USACE	Paul Wiesner, DMS	Jeff Keaton, Wildlands
Mac Haupt, DWR	Harry Tsomides, DMS	Kristi Suggs, Wildlands
Erin Davis, DWR	Joe Famularo, DMS	Ian Eckardt, Wildlands

Materials
Wildlands Engineering Hopewell Mitigation Site MY4 Monitoring Report dated December 13, 2018.

Meeting Notes

The purpose of the tour was to present the site to a group of IRT members and to get input into the condition of the site at this point in the monitoring period. Jeff Keaton of Wildlands Engineering, Inc. (Wildlands or WEI) began the meeting by giving the IRT members an overview of the project site. Then, portions of each of the project reaches were walked and discussed by the group.

1. UT2C

The tour began with Reaches 1 and 2 of UT2C. Jeff pointed out that the stream is spring fed and consistently has good flow. Reach 2 is a short reach where restoration was performed. The group only looked at a short section of this reach. Reach 1 is an enhancement reach. Todd Tugwell asked what work was done on the reach. Jeff and Shawn Wilkerson explained that the work consisted of fencing out cattle, planting trees in the left floodplain buffer zone, and treating privet. Todd noted several small privet trees, mostly in the right buffer area. Jeff explained that Wildlands has been treating privet every fall but not necessarily every location every year.

At this point, Erin Davis of DWR asked about the status of the issues with the fencing on the project. Jeff explained that there were a few spots where the fence was incorrectly installed inside the easement in short sections or a post was placed right on an easement corner. There was also an area on Little River where cows

were able to get into the easement and into the river. Jeff explained that the fencing issues have been corrected except for one small area on UT1 B where the landowner has refused to allow the fence to be moved.

Shawn explained that Wildlands has discussed this area with the landowner multiple times. Wildlands attempted to modify the easement, so that the existing fence would be outside of it, but DMS would not allow it. Shawn stated the next and last step would be for Wildlands to send a letter explaining that if the fence is not relocated outside of the easement, that State would further pursue the issue and legally require the fence to be moved. Shawn said that the letter would go out within a few of weeks after the completion of the site visit.

2. UT2A Reach 2

The tour continued with UT2A Reach 2. The stream was difficult to access due to vegetation growth within the easement. A short section was walked. The group seemed to agree that the stream looked stable and that the tree growth was good. Shawn mentioned that this small stream has always had flow.

3. UT2B

Next, the group walked the lower section of UT2B. Todd was interested to see how much privet remained along this reach. Many dead privet plants that had been treated the previous fall were observed but a few plants remained.

4. UT2A Reach 1

The group walked a portion of UT2A next. Jeff explained that this Enhancement I reach was constructed by adding a series of riffles to raise the bed of the stream. Portions of the reach were completely reconstructed. It was noted that there was previously a lot of privet in this area too, but that it has been successfully treated.

5. UT2 Reach 1

The group walked a short section of this reach. It was difficult to access due to dense vegetation growth within the easement. It was noted that the stream looked stable.

6. UT1B Reach 1

At this point, the group drove to the east side of the property. The first area visited on the east side of the site was UT1B Reach 1. There was discussion about this area because the planted vegetation is not performing as well as the rest of the site and sweetgums and pines have proliferated in the last couple of years. Jeff explained that, due to the cut in this area, the soils were not as good for growing the planted trees. Todd stated that this area is not meeting the intent of the mitigation plan or the success criteria for vegetation. It was also noted that the stream channel has a lot of herbaceous growth, probably due to the open canopy.

Todd and Mac suggested that Wildlands should remove the sweetgums and some of the pines and replant the trees specified in the planting plan, possibly as containerized plants rather than bare roots. Shawn indicated that he agreed, and Wildlands would conduct the activities during the next planting season. There was also an agreement that no work, such as removing in-stream vegetation or sediment by raking, hand digging, or other mechanical means, should be conducted in the channel. Instead, the planting of some of the proposed container plants, closer to the stream's top of bank, would be implemented in order to shade out the in-stream wetland vegetation.

The group also looked at the area where the landowner would not allow the fence to be moved (previously referenced in Section 1. UT2C). During this discussion, Kristi Suggs said she believed the corner fence post was about 32 feet inside the easement. Jeff stated that the buffer width in this area is still at least 50 feet. Shawn

reiterated his earlier statement from when the group was walking UT2C. The IRT also felt that the fence line should be moved out to the easement, reiterating Wildlands' and DMS' position.

Wildlands indicated that they will send the landowner a letter, within the next few weeks, asking the property owner once again to allow the fence line to be moved, in order to be easement-compliant, or the matter will be turned over to the State for possible legal action. Wildlands will let DMS look at the WEI letter before it is sent to the landowner. The letter will explain to the landowner that the fence needs to be moved into alignment with the easement and will give a timeline (60 days) for completion.

7. UT1A Reach 1

The group then walked to UT1A. There have been questions about the possibility that this stream is ephemeral. During the site visit the stream was flowing. Jeff and Ian Eckardt explained that Wildlands had installed a trail cam and had about 6 months of data indicating that the stream had flow continuously through that period. Todd asked what work had been done on this reach. Jeff stated that cows had been fenced out and supplemental planting had been done outside the woods line on the left floodplain.

8. Little River

The group walked a short portion of Little River. Shawn pointed out how successful the privet removal had been in this area. A large debris jam in the river was noted.

9. UT1B Reach 3

The last reach the group looked at was UT1B Reach 3. There have been some concerns that this reach, which is below the pond dam, would have issues with maintaining adequate flow frequencies. The stream was flowing on this day, and Wildlands indicated that flow frequencies have not been of issue on the reach.

10. Summary Discussion

Back at the vehicles, the group briefly discussed the overall site. Todd stated that the main issues are the vegetation problems on UT1B Reach 1, the remaining fencing issue on that reach, and on-going privet treatment throughout the site. The IRT agreed to release MY4 credits per the credit release schedule established in the approved Mitigation Plan.

These meeting minutes were prepared by Jeff Keaton and Kristi Suggs on June 6, 2019 and reviewed by Shawn Wilkerson on June 7, 2019 and represent the authors' interpretation of events. The minutes were subsequently revised on 6/14/2019 to incorporate comments received in an email from Harry Tsmoides with DMS on 6/12/2019.
