## **1.0 EXECUTIVE SUMMARY / PROJECT ABSTRACT**

The Jacob's Landing Stream Restoration Site is a full-delivery project that was developed for the North Carolina Division of Mitigation Services (DMS). Construction was completed in November 2013. The site includes the restoration of 4,484 linear feet of restoration and 109 linear feet of enhancement on four tributaries to Irish Buffalo Creek in the Yadkin-Pee Dee River Basin. The project is located west of China Grove and north of Kannapolis off of Saw Road in Rowan County (Figure 1, Appendix A). This project will expand aquatic and terrestrial habitat in the Rocky River Watershed (03040105). The project is within the 03040105020040 Irish Buffalo Creek Local Watershed Unit (14-digit HUC) (NCDENR, EEP 2009). In DMS' most recent publication of excluded and Targeted Local Watersheds/Hydrologic Units, the 03040105020040 14-digit HUC has been identified as a Targeted Local Watershed. The project is located in the Piedmont Physiographic Province and the project streams initiate as headwater systems out of moderately-sloped, forested hills before reaching the floodplain of Irish Buffalo Creek. The site's 0.72-square mile watershed is mostly pasture and mixed hardwoods with small pockets of rural residential development. Prior to construction the site was actively used for timber and cattle production for over five generations.

The project goals and objectives are listed below.

### *Project Goals*

- Restore a diverse riparian corridor that connects forested stream systems upstream and downstream of the project.
- Reduce the sediment supply entering Irish Buffalo Creek.

### *Project Objectives*

- Restore stable channel planforms to streams that have been straightened and modified.
- Reshape and stabilize eroding stream banks.
- Plant the site with native trees to help reestablish a diverse riparian corridor.
- Install exclusion fencing and alternative watering options to keep livestock out of the project streams.

Vegetation success is based on the criteria established in the USACE Stream Mitigation Guidelines (2003). This document states that vegetation monitoring results should have the following planted stem density minimums in the corresponding monitoring years: 320 stems/acre through Year Three, 288 stems/acre in Year Four, and 260 stems/acre in Year Five. The third-year vegetation monitoring was based on the Level 2 CVS-EEP vegetation monitoring protocol. The site's average density for this monitoring period is 411 planted stems/acre, with none of the plots having live stakes planted in them. Nine of the thirteen plots had greater than 320 planted stems/acre. There are four monitoring plots that have calculated planted stem densities less than 320 stems/acre; (Plots 1, 3, 4, and 6). This is not seen as problematic given the high potential for desirable volunteers to become established in the plots and across the site. Like natural vegetative communities, some areas will have slightly higher densities than others, but the data from the vegetation monitoring plots reveal that the site has an adequate average stem density. To ensure continued vegetative success, some parts of the site received supplemental planting in early 2015. Including volunteers, the monitoring plots averaged 1,161 total stems/acre. The overall vegetation assessment found the site to be on track to meeting the vegetative success criterion.

Third-year monitoring found the Jacob's Landing Site to be stable, with only minor changes from the as-built conditions. Two small areas of bank erosion that were reported on T1 in last year's report were repaired with soil lifts in the beginning of 2016. The monitoring components were installed in February/March 2014. Two automatic recording gauges have been installed along T1 and T2. Both stream gauges recorded several bankfull events during 2016. The monitoring plan for each tributary is as follows: T1 has a 1,500 foot longitudinal profile,

3 riffle cross-sections, and 1 pool cross-section; T2 has a 1,500 foot longitudinal profile, 5 riffle cross-sections and 2 pool cross-sections; T1A and T2A are being monitored visually since they are short reaches and small channels. Pebble counts were conducted at all eleven cross-sections. Ten permanent photo reference points have been established with a total of twenty-two photos to be taken annually. The third year of monitoring found the site to be functioning and T2 shows little change from the baseline conditions with the exception of two areas of aggradation near the end of the reach. T1 shows areas of aggradation throughout the upper three quarters of the reach. This is likely due to the high volume of sediment moving through the reach and the yearly fluctuations that this creates. It is not seen as an indicator of instability in the reach, but will be monitored to ensure it does not become a problem for the site.

Summary information/data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the Baseline Monitoring Report and in the Mitigation Plan documents available on the DMS' website. All raw data supporting the tables and figures in the appendices are available from DMS upon request.

## **2.0 METHODOLOGY**

The survey data were collected with a total station instrument on June 10, 16, 17, and December 8, 2016.

Some of the cross-sections have shown minor settling in the floodplain. The bankfull elevations at these cross-sections have not been changed to reflect this. For calculating cross-sectional morphologic data the cross-section width has been limited to a width that appropriately reflects the top of bank location so as not to inaccurately skew data.

The CVS-EEP protocol, Level 2 (<http://cvs.bio.unc.edu/methods.htm>) was used to collect vegetation data from the site. The vegetation monitoring was completed on June 31, 2016.

<b>Metadata</b>	Description of database file, the report worksheets, and a summary of project(s) and project data.
<b>Proj, planted</b>	Each project is listed with its PLANTED stems per acre, for each year. This excludes live stakes.
<b>Proj, total stems</b>	Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems.
<b>Plots</b>	List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.).
<b>Vigor</b>	Frequency distribution of vigor classes for stems for all plots.
<b>Vigor by Spp</b>	Frequency distribution of vigor classes listed by species.
<b>Damage</b>	List of most frequent damage classes with number of occurrences and percent of total stems impacted by each.
<b>Damage by Spp</b>	Damage values tallied by type for each species.
<b>Damage by Plot</b>	Damage values tallied by type for each plot.
<b>Planted Stems by Plot and Spp</b>	A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded.
<b>ALL Stems by Plot and spp</b>	A matrix of the count of total living stems of each species (planted and natural volunteers combined) for each plot; dead and missing stems are excluded.
<b>PROJECT SUMMARY-----</b>	
<b>Project Code</b>	95024
<b>project Name</b>	Jacob's Landing
<b>Description</b>	Stream Restoration Site
<b>River Basin</b>	Yadkin-Pee Dee
<b>length(ft)</b>	4593
<b>area (sq m)</b>	0.72
<b>Required Plots (calculated)</b>	13
<b>Sampled Plots</b>	13
