1.0 Executive Summary

Project goals and objectives for the Overhills stream and wetland restoration project include:

- Restoration of stream dimension, pattern and profile
- Restoration of riverine wetland hydrology and vegetation
- Improvement of current water quality
- Protection of future water quality

The Monitoring Year 4 stem counts within each of the vegetative monitoring plots are included in Table 7 in Appendix C. Seven of the plots have over 288 stems per acre (the success criteria for monitoring year four) while two of the plots have less than 288 stems per acre. Many of the same vegetation problem areas that have been observed during previous monitoring years are still present onsite. These problem areas are referred to as VPA 1 through 17 in the Current Condition Plan View located in Appendix A. In VPA 1, 2, 4, 12, 13, and 14 persistent flooding has occurred and has caused the majority of the planted woody vegetation to die in those areas. Standing water continues to be present in these areas. Other areas onsite are also flooded but are not listed as problem areas because the planted vegetation, especially *Taxodium*, is doing well. VPA 3, 5, 6, 8, 9, 10, 15, 16 and 17 are currently overrun with invasive species, primarily *Lespedeza* although *Typha latifolia* is present in a few wetter areas on site. It appears that the *Lespedeza* has lessened in extent from previous monitoring years due to higher water levels onsite. A few areas have been noticeably impacted by beaver foraging and are shown on the CCPV as VPA 7 and 11.

The major stream problem area continues to be the headcut and downstream reach located from station 31+94 to 44+00. In this area and downstream, the stream has failed. The headcut most likely first began at the location where the design changes from a C5 to an E5 channel between the Upper and Lower reaches at Station 33+00. Downstream of this headcut, most of the in-stream structures have failed and erosion is occurring. Erosion around the structures has forced the banks to migrate as much as ten feet, making this section of stream extremely unstable. Because of the vast migration of the stream channel, the stream has become over-widened in many sections, which has lead to mid-channel bar formations. This year it appears that the headcut has stabilized and did not move substantially compared to last year. Upstream of the headcut, normal water surface elevations are at or near the constructed bankfull elevation, allowing the channel to access the floodplain under very small storm events. The areas immediately adjacent to this section of the channel were ponded near the channel banks. Despite ongoing efforts to remove beavers multiple beaver dams remain causing large areas of the floodplain to become inundated with water, some areas over 1 foot in depth. Headcuts are occurring in areas where the inundated water reenters the stream channel from the side. These areas are located at various locations along the streams right bank. The beaver dams are located near Stations 2+75, 28+00 and 41+25. Repairs to the stream are scheduled for early 2011.

Other problems include downcutting at cross-sections XS 6, and widening at XS 4. These channel changes may be attributed to an undersized channel upstream.

The reference well met the hydrology success criteria, with three periods of consecutive days of saturation within 12 inches of the ground surface (103, 48, and 43 days respectively). This 194 day period comprises approximately 83% of the growing season. Additionally, all fifteen groundwater monitoring wells onsite met the hydrology success criteria, with 10 of the wells being within 12 inches of the ground surface for 80% of the growing season. Monthly precipitation averages for 2010 fell between the 30th and 70th percentiles during the growing season in June and July. For the month of April precipitation fell below the 30th percentile. For the months of January, March, May, and September, precipitation fell above the 70th percentile.

Summary information and data related to the occurrence of items such as beaver or encroachment, and statistics related to performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the mitigation and restoration plan documents available on EEP's website. All raw data supporting the tables and figures in the appendices is available from EEP upon request.

2.0 Methodology

2.1 VEGETATION ASSESSMENT

The Carolina Vegetation Survey (CVS) Level 2 methodology was utilized to sample vegetation in September of 2010. Ten 100m² plots have been established throughout the project. In each plot, two plot corners have been permanently located with conduit or rebar. As per the mitigation plan, the vegetative success criteria are based on the US Army Corps of Engineers Stream Mitigation Guidelines (USACE, 2003). The final vegetative success criteria will be the survival of 260 5-year old planted trees per acre at the end of the year 5 monitoring period. An interim measure of vegetation planting success will be the survival of at least 288 4-year old planted trees per acre at the end of year 4 of the monitoring period.

2.2 STREAM ASSESSMENT

A longitudinal profile survey of the entire length of the project was completed in September 2010. The Upper Reach, classified as a Rosgen C5 stream, flows from the beginning of the project at Station 0+00 to Station 32+80. The Lower Reach, a Rosgen E5 stream, flows from 32+80 to the end of the project at Station 44+00. Additional data collected included riffle length, riffle slope, pool length and pool spacing. During the longitudinal survey, additional pattern data was collected including channel beltwidth, radius of curvature, meander wavelength and meander width ratio. Stability was also visually assessed. A total of nine permanent cross-sections were characterized. A new riffle cross-section, Cross Section 9, was added in 2008 to provide sufficient cross-sectional data for the Lower Reach. Data collected included, at a minimum, cross-sectional area, bankfull width, bankfull mean depth, bankfull max depth, floodprone width, width to depth ratio, and entrenchment ratio. Stream type was determined in riffle cross-sections only. Success will be measured based on whether the channel features stay within the natural variability of the dimensionless ratios of the reference reaches.

2.3 WETLAND ASSESSMENT

A site is considered to meet the success criteria for wetland hydrology if the groundwater saturation is within 12 inches of the ground surface consecutively for 12.5% of the growing season. Fifteen groundwater monitoring wells are currently active on the project site. All 15 wells met the success criteria during the growing season of 2010 (Appendix E). The growing season in this area is from March 18th to November 8th for a total of 234 days (NRCS 2002).

A reference well was installed within the reference site on October 2, 2007. Data has been collected since its installation. More specific details regarding the physical and biological characteristics of the reference site can be found in the Overhills Stream and Wetland Restoration Plan.

Directions to Overhills/Jumping Run Creek Restoration Site: From Raleigh, take US401 South following signs through Fuquay-Varina and into downtown Lillington. Turn right onto NC 27 and follow for about 9 miles, then turn left onto Nursery Rd. After 6.5 miles, Nursery Rd will come to a T, turn right to stay on Nursery Rd. The restoration site is half a mile from the T on the right hand side. To get to the reference site from the restoration site: Continue travelling east on Nursery Rd for 2 miles, then turn left onto NC24/NC87 for 3 miles. Turn right onto Vass Rd/NC 690. Continue for 3.5 miles, then turn right at sign that states "NO POVs" (this is part of Fort Bragg, need permission to enter). Follow the dirt road straight, at least 1.7 miles (do not turn or veer). The reference well is in the woods, about 100 feet from the end of the road.

Report Prepared By	Alex Baldwin
Date Prepared	11/2/2010 11:19
database name	Stantec_2010.mdb
database location	U:\171300316\project\1-Overhills\site_data\cvs
computer name	BALDWINA
file size	50065408
DESCRIPTION OF WORKSHEETS IN THIS DOCUMENT-----	
Metadata	Description of database file, the report worksheets, and a summary of project(s) and project data.
Proj, planted	Each project is listed with its PLANTED stems per acre, for each year. This excludes live stakes.
Proj, total stems	Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems.
Plots	List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.).
Vigor	Frequency distribution of vigor classes for stems for all plots.
Vigor by Spp	Frequency distribution of vigor classes listed by species.
Damage	List of most frequent damage classes with number of occurrences and percent of total stems impacted by each.
Damage by Spp	Damage values tallied by type for each species.
Damage by Plot	Damage values tallied by type for each plot.
Planted Stems by Plot and Spp	A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded.
ALL Stems by Plot and spp	A matrix of the count of total living stems of each species (planted and natural volunteers combined) for each plot; dead and missing stems are excluded.
PROJECT SUMMARY-----

Feature Category	Metric (per As-built and reference baselines)	(# Stable) Number Performing as Intended	Total Number per As-built	Total Number/Feet in Unstable State	% Perform in Stable Condition	Feature Perform. Mean or Total
A. Riffles	1. Present?	0	7		0%	
	2. Armor stable (eg no displacement?)		N/A		NA	
	3. Facet grade appears stable?	0	7		0%	
	4. Minimal evidence of embedding/fining?	4	N/A		NA	
	5. Length appropriate?	1	7		14%	5%
B. Pools	1. Present? (e.g. not subject to severe aggrad. or migrat.?)	2	8		25%	
	2. Sufficiently deep (Max Pool D:Mean Bkf > 1.6?)	4	8		50%	
	3. Length appropriate?	4	8		50%	42%
C. Thalweg	1. Upstream of meander bend (run/inflection) centering?	2	9		22%	
	2. Downstream of meander (glide/inflection) centering?	2	9		22%	22%
D. Meanders	1. Outer bend in state of limited/controlled erosion?	1	9		11%	
	2. Of those eroding, # w/concomitant point bar formation?	1	9		11%	
	3. Apparent Rc within spec?	0	9		0%	
	4. Sufficient floodplain access and relief?	0	9		0%	6%
E. Bed General	1. General channel bed aggradation areas (bar formation)		1200	1200	100%	
	2. Channel bed degradation - areas of increasing down-cutting or head-cutting?		1200	1200	100%	100%
F. Bank	1. Actively eroding, wasting, or slumping bank?		1200	1200	100%	100%
G. Vanes	1. Free of back or arm scour?	0	22		0%	
	2. Height appropriate?	0	22		0%	
	3. Angle and geometry appear appropriate?	0	22		0%	
	4. Free of piping or other structural failures?	0	22		0%	0%
H. Wads/Boulders	1. Free of scour?	NA	N/A		NA	
	2. Footing stable?	NA	N/A		NA	NA
