1.0 EXECUTIVE SUMMARY / PROJECT ABSTRACT

The Little Troublesome Stream and Wetland Restoration Site, completed in December 2009, restored a total of 2,188 linear feet of stream in the Upper Cape Fear River Basin. In addition, there are approximately 4.5 acres of wetland preservation, 1.9 acres of wetland enhancement, and 2,754 linear feet of stream preservation within the site. The project is located in the USGS Hydrologic Unit 03030002-01-0030 of the Cape Fear River Basin. This HU is within the EEP's Upper Cape Fear Basin Local Watershed Plan and is also listed as a Targeted Local Watershed (TLW) in EEP's Cape Fear River Basin Priorities Plan (2009). The project goals and objectives are listed below.

Project Goals

- Restore a stable channel morphology to the project stream that is capable of moving the flows and sediment provided by its watershed.
- Improve water quality for an NCDWQ stream, classified as a Class C and Nutrient Sensitive Waters by reducing bank erosion and bed degradation.
- Enhance aquatic and terrestrial habitat.
- Enhance and preserve existing wetlands and forested buffers.

Project Objectives

- Restore 2,188 linear feet of stable stream channel with the appropriate pattern, profile, and dimension that can support a gravel transport system
- Restore a natural riparian buffer.
- Restore the hyporheic zone in the project streams and re-establish the natural stream features.
- Plug ditches to increase groundwater input to existing wetlands.
- Plant native trees and shrubs throughout the site.

The vegetation monitoring success criterion for the planted stream riparian zone is a density of 320 stems/acre after the third year of monitoring and an allowance for 10% mortality in the fourth and fifth years with a final density of 260 stems/acre. The second-year vegetation monitoring was based on the Level 2 CVS-EEP vegetation monitoring protocol. The site's average density for this monitoring period was 642 planted stems/acre, including live stakes, and 612 planted stems/acre, excluding live stakes. All of the eight plots had greater than 320 planted stems/acre. There are many volunteer woody stems throughout the site. Including volunteers, the monitoring plots averaged 3,065 total stems/acre. The 2011 monitoring found that the slope from the left bank of the tributary to the terrace (the north-facing slope) had sparse vegetation coverage with some bare areas. There has been high live stake survival along the tributary and variable survival along Little Troublesome Creek. Small sporadic areas of multiflora rose are present throughout the north side of Little Troublesome.

Second-year monitoring found Little Troublesome Creek to be stable, with only minor changes from the as-built and Year One conditions. The tributary has had areas of localized bed degradation and bank erosion since construction. These areas do not appear to be actively destabilizing and the plentiful streamside vegetation should continue to help stabilize these parts of the tributary. There are isolated areas of erosion on the south slope leading down to the tributary and on outer bends of Little Troublesome. These areas are not presently causing destabilization of the project, but should continue to be monitored. The longitudinal and cross-sectional data also reflect overall stability in the project streams. As a part of the stream success criterion, the stream must experience at least two bankfull events, each in separate monitoring years. The site has experienced multiple bankfull events since construction.

Summary information/data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in the tables and

figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the Baseline Monitoring Report (formerly Mitigation Plan) and in the Mitigation Plan (formerly the Restoration Plan) documents available on the EEPs website. All raw data supporting the tables and figures in the appendices are available from EEP upon request.

2.0 METHODOLOGY

The survey data were collected with a total station instrument the week of July 18, 2011.

The stationing for the longitudinal profile is based on the thalweg stationing and has been adjusted to match grade control structures from previous longitudinal profiles.

Some of the cross-section surveys on Little Troublesome Creek showed slightly lower top of bank measurements than the baseline measurements. In the cases where the top of bank measurement was only nominally lower than the bankfull elevation, the bankfull width was limited to just include the distance between the tops of left and right banks. This ensures that the bankfull width measurement is representative of the cross-section, and not abnormally large because of insignificant changes in the surveyed cross-section.

The CVS-EEP protocol, Level 2 (http://cvs.bio.unc.edu/methods.htm) was used to collect vegetation data from the site. The vegetation monitoring was completed during the week of August 22, 2011.

	2. Undercut	Banks undercut/overhanging to the extent that mass wasting appears likely. Does <u>NOT</u> include undercuts that are modest, appear sustainable and are providing habitat.			1	10	99%	0	0	99%
	3. Mass Wasting	Bank slumping, calving, or collapse			0	0	100%	0	0	100%
				Totals	9	90	94%	1	12	95%
3. Engineered Structures	1. Overall Integrity	Structures physically intact with no dislodged boulders or logs.	2	2			100%			
	2. Grade Control	Grade control structures exhibiting maintenance of grade across the sill.	2	2			100%			
	2a. Piping	Structures lacking any substantial flow underneath sills or arms.	2	2			100%			
	3. Bank Protection	Bank erosion within the structures extent of influence does not exceed 15%. (See guidance for this table in EEP monitoring guidance document)	0	0			N/A			
	4. Habitat	Pool forming structures maintaining \sim Max Pool Depth: Mean Bankfull Depth ratio ≥ 1.6 Rootwads/logs providing some cover at base-flow.	0	0			N/A			

^{*}Due to this reach's small size and the scale of the pattern, the exact position of the thalweg in relation to the meanders and morphological features is inconsistent and not practical to evaluate.

Table 6. Vegetation Condition Assessment

Project Number and Name: 749 - Little Troublesome

Planted Acreage 12.2 Easement Acreage 30.3

Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Planted Acreage
1. Bare Areas	Very limited cover of both woody and herbaceous material.	0.1 acre	Pattern and Color*	0	0.00	0.0%
2. Low Stem Density Areas	Woody stem densities clearly below target levels based on MY3, 4, or 5 stem count criteria.	0.1 acre	Pattern and Color ⁺	2	0.30	2.5%
			Total	2	0.30	2.5%
3. Areas of Poor Growth Rates or Vigor	Areas with woody stems of a size class that are obviously small given the monitoring year.	0.25 acre	Pattern and Color	0	0.00	0.0%
		Cu	mulative Total	2	0.30	2.5%
4. Invasive Areas of Concern	Areas or points (if too small to render as polygons at map scale).	1,000 SF	Pattern and Color	0	0.00	0.0%
5. Easement Encroachment Areas	Areas or points (if too small to render as polygons at map scale).	none	Pattern and Color	0	0.00	0.0%

^{*}These areas were not depicted on the CCPV. Generally, the left slope of UT1 has many small scattered bare areas that are below the mapping threshold, but are significant when combined.

⁺These areas were not depicted on the CCPV. Generally, the left and right slopes of UT1 have many scattered areas of noticable low stem densities that are below the mapping threshold, but are significant when combined.
