# **LOFLIN DAIRY BUFFER MITIGATION SITE**

Randolph County, NC NCDEQ Contract No. 003995 NCDMS ID No. 95008

Data Collection Period: July 2015 Draft Submission Date: August 28, 2015 Final Submission Date October 7, 2015

## **PREPARED FOR:**

NC Department of Environmental Quality, Division of Mitigation Services 1652 Mail Service Center Raleigh, NC 27699-1652

## **PREPARED BY:**

Wildlands Engineering, Inc. 1430 S. Mint Street, Suite 104 Charlotte, NC 28203

> Phone: 704.332.7754 Fax: 704.332.3306

#### **EXECUTIVE SUMMARY**

The Loflin Dairy Buffer Mitigation Site, hereafter referred to as the Site, is located within the Randleman Reservoir watershed of the Cape Fear River Basin. On-site stream channels are unnamed tributaries to Bob Branch, which drains to the Randleman Regional Reservoir. The Site is located in the Carolina Slate Belt of the Piedmont Physiographic Province (USGS, 1998) approximately six miles southeast of the intersection of Interstate 85 and Highway 311 in Randolph County, NC. Directions and a map of the Site are provided in Figure 1 (Appendix 1). The Site has historically been used for agricultural purposes, and is surrounded by fields that are alternately used for cattle and crop production. A conservation easement has been recorded to protect 9.8 acres of riparian corridor resources in perpetuity. The project is being completed to provide buffer mitigation units (BMUs) in the Cape Fear River Basin, and will include 9.1 acres in buffer restoration. The remaining protected acreage is buffer preservation not sought for credit. See Table 1 (Appendix 1) for a summary of project components and mitigation credits. A map of the conservation easement and project reaches is provided in Figure 2 (Appendix 1).

The goals of the Site address water quality improvements identified in the Cape Fear River Basin Restoration Priorities Report (RBRP) (NCEEP, 2009) and include the following:

- · Remove harmful nutrients from creek flow;
- Reduce pollution of creek by excess sediment;
- · Restore terrestrial habitat; and
- Improve aesthetics.

The following project objectives were established in the Loflin Dairy Buffer Mitigation Site Mitigation Plan (2012) to meet the RBRP goals:

- 9.1 acres of riparian area will be fenced off from adjacent agricultural activities and runoff will be filtered through buffer zones. Flood flows will be filtered through restored riparian areas, where flood flow will spread through native vegetation. Vegetation will be planted to uptake excess nutrients;
- Stream bank erosion which contributes sediment load to the creek will be greatly reduced, if not
  eliminated, in the project area. Eroding streambanks will be stabilized by increased woody root
  mass in banks and reducing channel incision. Storm flow containing grit and fine sediment will
  be filtered through restored riparian buffer areas, where flow will spread through native
  vegetation;
- The establishment and maintenance of riparian buffers will create long-term shading of the channel bed, reducing thermal heating and improving aquatic habitat; and
- Adjacent buffer and riparian habitats will be restored with native vegetation and invasive species will be treated as part of the project. Native vegetation will provide cover and food for terrestrial creatures.

Overall, the Site has met the required buffer mitigation success criteria for the fourth year of annual monitoring (MY4). Although three vegetation plots (4, 6, and 15) did not meet the MY4 success criteria, the average stem density of the Site is greater than the required MY4 success criteria. Areas with Johnson grass (*Sorghum halepense*) and patches of other invasive species observed in MY4 will be treated and maintained as needed throughout the monitoring period to ensure minimal advancement occurs within the Site.

#### 1.0 PROJECT OVERVIEW

The Loflin Dairy Buffer Mitigation Site, hereafter referred to as the Site, is located within the Randleman Regional Reservoir watershed (North Carolina Division of Water Resources (NCDWR) Subbasin 03-06-08) of the Cape Fear River Basin (United States Geological Survey (USGS) Hydrologic Unit Code (HUC) 03030003010060). On-site stream channels are unnamed tributaries to Bob Branch (NCDWR Index No. 17-9.6-(1)) which drains to the Randleman Regional Reservoir. The Site is located in the Carolina Slate Belt of the Piedmont Physiographic Province (USGS, 1998) approximately six miles southeast of the intersection of Interstate 85 and Highway 311 in Randolph County, NC. Directions and a map of the Site are provided in Figure 1 (Appendix 1).

The Site is surrounded by fields that are alternately used for cattle and crop production. The Site is comprised of two areas (Area A and B) on one parcel of land along several unnamed tributaries and ephemeral ditches to Bob Branch. A map of the conservation easement and project reaches is provided in Figure 2 (Appendix 1). The Site has historically been used for agricultural purposes. The current property owner has confirmed that Area A was used as an active dairy farm since 1947 and Area B has been surrounded by agricultural fields since the late 1920s. Bob Branch is a direct tributary to the Randleman Regional Reservoir. The reservoir is a regional water supply and stream buffer protection rules are in place throughout the watershed. At the downstream limits of the project, Area A has a drainage area of 18 acres (0.03 square miles) and Area B has a drainage area of 59 acres (0.09 square miles).

The NCDWR assigns best usage classifications to State Waters that reflect water quality conditions and potential resource usage. Bob Branch is classified as Class WS-IV waters. Class WS-IV waters are used as sources of water supply for drinking or food processing purposes where a more restrictive WS-I, WS-II, or WS-III classification is not feasible. These waters are also protected for Class C uses such as secondary recreation, fishing, wildlife, fish and aquatic life propagation and survival, and agriculture. WS-IV waters are generally in moderately to highly-developed watersheds or Protected Areas. This portion flowing into the Randleman Regional Reservoir is located within the Critical Area or area within one-half mile of a water supply

A conservation easement has been recorded to protect 9.8 acres of riparian corridor resources in perpetuity. The project is being completed to provide buffer mitigation units (BMUs) in the Cape Fear River Basin and will include 9.1 acres of buffer restoration. The remaining protected acreage is buffer preservation not sought for credit. See Table 1 (Appendix 1) for a summary of project components and mitigation credits.

#### 1.1 Project Goals and Objectives

Prior to construction activities, the primary watershed stressor was the lack of a vegetated buffer and nutrient runoff from adjacent agricultural maintenance activities. The riparian zones within these areas were maintained and mowed on an annual basis resulting in varying buffer widths and densities. The riparian zones were also actively sprayed due to their locations in an active row crop field and cattle pasture. A concentrated flow of cattle waste drained directly to several of the tributaries located adjacent to the dairy farm. Although there is no immediate evidence of increased development within the project site's watersheds; the new NC Highway 311 corridor has been constructed immediately downstream of the project area. This new highway corridor may increase development pressure on the project's watersheds and this area of Randolph County in the future. The restored riparian buffer areas within the Site will aid in protecting water quality and endangered species habitat within the Deep River

watershed by filtering runoff from adjacent agricultural practices and restoring terrestrial habitat. The Deep River watershed is an important component of the Randleman Regional Reservoir in this part of the state. Riparian stream buffers were planted and restored to the dominant natural plant community that exists within the project watershed. This natural community within and adjacent to the project easement is classified as Piedmont Bottomland Forest and was determined based on existing canopy and herbaceous species (Schafale and Weakley, 1990). Tables 1-4 in Appendix 1 present detailed information for pre and post restoration conditions.

The goals of the Site address water quality improvements identified in the Cape Fear River Basin Restoration Priorities Report (RBRP) (NCEEP, 2009) and include the following:

- Remove harmful nutrients from creek flow;
- Reduce pollution of creek by excess sediment;
- · Restore terrestrial habitat; and
- Improve aesthetics.

The following project objectives were established in the Loflin Dairy Buffer Mitigation Site Mitigation Plan (2012) to meet the RBRP goals:

- 9.1 acres of riparian area will be fenced off from adjacent agricultural activities and runoff will
  be filtered through buffer zones. Flood flows will be filtered through restored riparian areas,
  where flood flow will spread through native vegetation. Vegetation will be planted to uptake
  excess nutrients;
- Stream bank erosion which contributes sediment load to the creek will be greatly reduced, if not
  eliminated, in the project area. Eroding streambanks will be stabilized by increased woody root
  mass in banks and reducing channel incision. Storm flow containing grit and fine sediment will
  be filtered through restored riparian buffer areas, where flow will spread through native
  vegetation;
- The establishment and maintenance of riparian buffers will create long-term shading of the channel bed, reducing thermal heating and improving aquatic habitat; and
- Adjacent buffer and riparian habitats will be restored with native vegetation and invasive species will be treated as part of the project. Native vegetation will provide cover and food for terrestrial creatures.

## 1.2 Monitoring Year 4 Data Assessment

The final mitigation plan was submitted and accepted by the North Carolina Department of Mitigation Services (NCDMS) in February 2012. Grading activities were completed by the landowner in March 2012. Planting activities were completed by Bruton Natural Systems, Inc. in March 2012. The baseline monitoring and as-built survey were completed in April 2012. There were no significant deviations reported in the project elements in comparison to the design plans. Appendix 1 provides more detailed project activity, history, contact information, and watershed/site background information for this project.

The buffer restoration success criteria for the Site follows the approved success criteria presented in the NCEEP Mitigation Plan Guidance (Version 2.0, 10/01/2010). Biannual monitoring was conducted to assess the Site conditions in April and July 2015.

#### 1.2.1 Vegetative Assessment

A total of 16 vegetation plots were established within the project easement area using standard 10 meter by 10 meter vegetation monitoring plots. Plots were randomly established within planted portions of the stream buffer areas to capture the heterogeneity of the designed vegetative communities. The plot corners have been marked and are recoverable either through field identification or with the use of a GPS unit. Reference photographs at the origin looking diagonally across the plot to the opposite corner were taken with the as-built and during annual monitoring. The final vegetative success criteria will be the survival of 320 planted stems per acre in the buffer corridor at the end of year five (MY5) of the monitoring period. Along with the stem density requirement, the final planted vegetation community must also include at least two different planted species to be considered successful. The extent of invasive species coverage will also need to be monitored and controlled as necessary.

The MY4 average stem density for the Site is 405 stems per acre, which is 53% of the baseline (MY0) density recorded (764 stems per acre) in April 2012. There is an average of 10 stems per plot in MY4 compared to 10 stems per plot in MY3, 11 stems per plot in MY2, 13 stems per plot in MY1 and 19 stems per plot in MY0. Of the 16 plots, 13 met the success criteria required for MY4. Vegetation plots 4, 6 and 15 did not meet the MY4 success criteria due to insufficient stem density. In addition, while Plot 15 does not meet the requirement of having at least two different planted species, natural woody stems do add some diversity to the stratum. Vegetation Plots 4, 6 and 15 had a high initial mortality rate in MY1 and MY2, but stem death has tapered off with no mortality in MY4. The majority of remaining stems have excellent growth and vigor scores. While plot 6 did not meet the interim success criteria, this plot is on track to meet the final mitigation success requirements with the inclusion of volunteer species.

Areas of Johnson grass (*Sorghum halepense*) were noted onsite. Other invasive plants including Japanese honeysuckle (*Lonicera japonica*), Chinese privet (*Ligustrum sinense*), and morning glory (*Ipomea sp.*) were observed as well. Spot treatment of invasive plants with herbicide is planned for the current year to control these species and prevent further spreading. Please refer to Appendix 2 for vegetation plot photographs and visual assessment data and Appendix 3 for vegetation plot data.

## 1.3 Monitoring Year 4 Summary

Overall, the Site has met the required buffer mitigation success criteria for MY4. Although three vegetation plots (4, 6 and 15) did not meet the MY4 success criteria, the average stem density of the Site is greater than the required MY4 success criteria. The areas of Johnson grass and patches of other invasive species observed in MY4 will be treated and maintained as needed throughout the monitoring period.

Summary information/data related to the performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the Mitigation Plan documents available on NCDMS's website. All raw data supporting the tables and figures in the appendices are available from NCDMS upon request.

## 2.0 METHODOLOGY

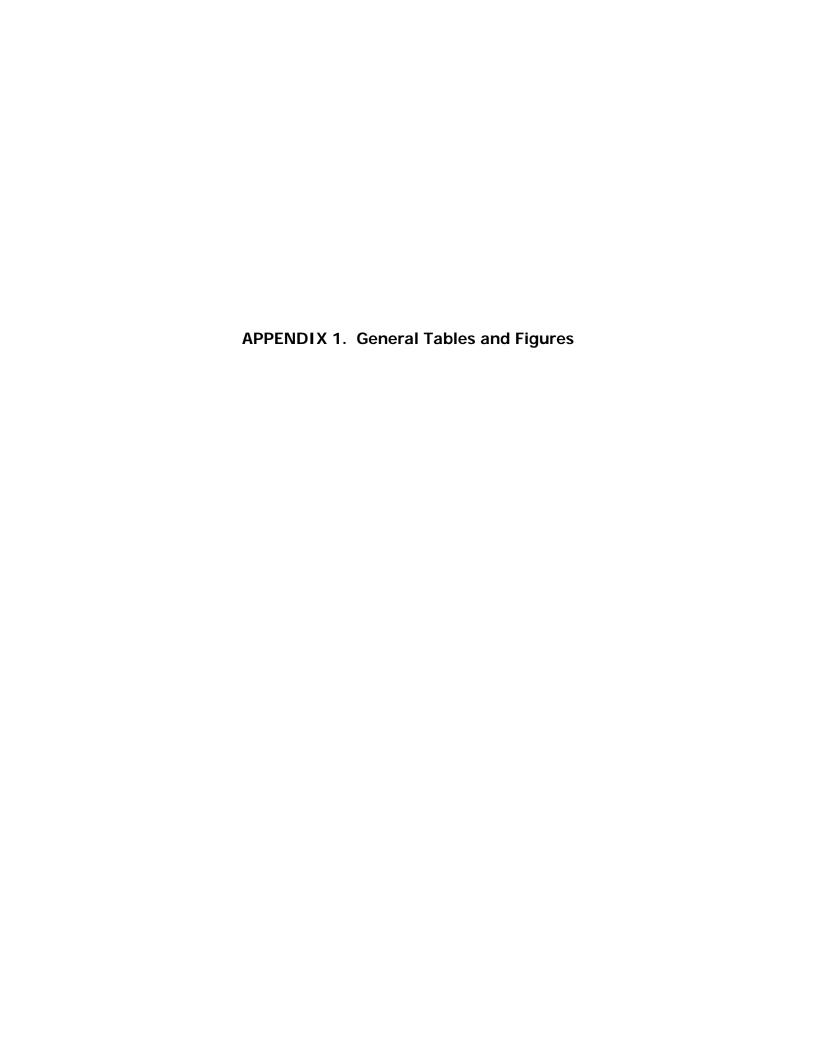

Vegetation monitoring protocols followed the Carolina Vegetation Survey-NCEEP Level Two Protocol (Lee et al., 2008).
