Introduction and Background

In November 2004 the NC Ecosystem Enhancement Program awarded Greene Environmental Services a contract to restore 50 acres of riparian buffer along unnamed tributaries to Contentnea Creek and Little Contentnea Creek in southeastern Greene County, NC (Figure 1) (Phase 2). The project was a continuation of the successful Phase 1 project that restored 37.1 acres of riparian buffers along the unnamed tributary to Contentnea Creek. The Contentnea Creek/Little Contentnea Creek Riparian Buffer Restoration Plan was implemented in 2004 with site preparation, the planting of 26,000 saplings of 14 species, and the establishment of 53 monitoring quadrats in 16 sampling units, as specified in the project's Mitigation Plan (GES, 2004) (Figure 2).

Woody stem density, cross-sectional area, and height monitoring was conducted during October and November 2005 within each 100 square meter quadrat, as detailed in the Mitigation Plan. The monitoring results, management activities to date, and planned management activities are presented below.

Results

Stem density of planted species within the monitoring quadrats averaged 445 stems per acre; density of all woody stems (including those not planted) averaged 3,471 per acre (Table 1). **Both averages indicate that the project has exceeded its success criterion of 320 live woody stems per acre of no fewer than three species by 39 percent and 1,084 percent, respectively.**

Monitoring data indicate that *Fraxinus pennsylvanica* is the most abundant tree species among planted species (25.2 1 percent relative density). It is the third most abundant among all species (5.48 percent). *Acer rubrum* is the most abundant species when all species observed are included. The average of relative cross sectional area and relative density was calculated for planted species and all species and is presented below as the *Importance Value* (Table 1). Based on this calculation, “volunteer” species were dominant (*A. rubrum* 33.74, *Liquidambar styraciflua* 12.48, and *Pinus tadea* 4.24). Unidentified oaks (*Quercus* spp.) had the highest value among planted species. When considering only the planted species, *Betula nigra* was the most important (12.05), followed by *F. americana* (9.84), *Quercus* spp. (9.51) and *Platanus occidentalis* (7.67). The species with the greatest average height was *L. styraciflua*, which averaged 1.25 meters. The tallest planted species was *B. nigra* (0.96 meter).

Planted species' height averaged 0.41 meters. The height of all species combined averaged 0.44 meters. Stem diameter averaged 0.34 centimeters for all species and 0.38 centimeters for planted species.

Maintenance (completed and planned) and Anecdotal Observations

Spot application of herbicide (Roundup) was done around individual trees in May 2004 throughout the Phase 2 restoration area. In areas where weedy vegetation was too robust to respond to the herbicide application, selective manual weed removal was done using machetes and gasoline-powered string trimmers.

Greene Environmental Services, LLC
90 Ham Produce Road, Snow Hill, NC 28580 (252) 747-8200

Browsing evidence was observed in all monitoring units. Deer prints were observed in the soil near many trees with obvious branch tip browsing. While damage to branch tips may have affected overall height, it did not seem to result in any mortality. Rodent browsing at the base of the trees' main stems poses a more serious threat to survival. While no individuals observed were completely girdled, removal of vascular cambium around 50 to 60 percent of stem circumference was observed on many trees. Based on anecdotal observation, the relative number of trees impacted was small. Because of this and the woody stem density above the success threshold, the situation will be monitored, but no remedial action is planned.

In areas with observed mortality, remedial sapling planting will be done during late winter 2006. Planting density and species composition will be determined on a site-specific basis using available plant materials appropriate for the project. Concurrent with remedial sapling planting, worn and/or breached silt fences will be replaced and *Myrcia cerifera* container stock and *Salix nigra* live stakes will be in-planted on stream banks with evidence of erosion.
