Introduction and Background

In November 2004 the NC Ecosystem Enhancement Program awarded Greene Environmental Services a contract to restore 50 acres of riparian buffer along unnamed tributaries to Contentnea Creek and Little Contentnea Creek in southeastern Greene County, NC (Figure 1) (Phase 2). The project was a continuation of the successful Phase 1 project that restored 37.1 acres of riparian buffers along the unnamed tributary to Contentnea Creek. The Contentnea Creek/Little Contentnea Creek Riparian Buffer Restoration Plan was implemented in 2004 with site preparation, the planting of 26,000 saplings of 14 species, and the establishment of 53 monitoring quadrats in 16 sampling units, as specified in the project's Mitigation Plan (GES, 2004) (Figure 2).

Woody stem density, diameter, and height measurements were recorded in October 2006 within each of the 100 square meter quadrats, as detailed in the Mitigation Plan. The monitoring results, management activities to date, and planned management activities are presented below.

Results

During the fall 2006 monitoring, 538 planted woody stems were recorded within the 53 quadrats, resulting in an average density of 414 planted woody stems per acre (Figure 2) (Table 1). Additionally, a total of 2,059 *volunteer* woody stems were recorded inside the quadrats (833 *Acer rubrum* and 1,011 *Liquidambar styraciflua*). A total of 2,602 live stems woody stem were observed (1,986 stems per acre). **Average densities for planted stems and all live stems both indicate that the project has exceeded the success density criterion of 320 live woody stems per acre (129 percent and 620 percent, respectively).**

Monitoring data for planted stems indicate that *Fraxinus pennsylvanica* and *Platanus occidentalis* are the most abundant tree species (28.4 and 20.2 percent relative density). The average of relative diameter and relative density was calculated for planted species and is presented here as the importance value. Based on this calculation, *P. occidentalis* and *F. pennsylvanica* were the most important species in the project area, both with a value of 17.9 (Table 1). *Betula nigra* had the third-highest importance value, along with highest relative diameter (24.1 percent) and the greatest average height (12.25 feet). *Taxodium distichum* had the third-highest relative density among planted woody stems (12.7).

Maintenance (completed and planned) and Qualitative Observations

Like observed in 2005, areas that had a moderately dense canopy of early sucessional vegetation (e.g. *Conyza canadensis* and *Eupatorium capillifolium*, 60-80 percent foliar cover) experienced lower planted woody stem mortality. The herbaceous annual, biennial and short-lived perennial *pioneer* species appear to be maintaining soil moisture, which increases available water uptake by the planted individuals and reduces their evapotranspiration. Because planted species success quantitatively and qualitatively appears to be higher in areas with a moderately dense early sucessional herbaceous overstory, these areas will not be sprayed or cut in 2007.

Qualitative evaluation in late spring/early summer will identify locations with invasive, exotic woody species, including vines. Manual removal/control of the identified populations will involve machete and/or gasoline powered string trimmers, and, if necessary, very limited glycophosphate herbicide (Roundup) application, using hand pump or backpack sprayers with nose cone-tipped nozzles. *L. styraciflua* and *A. negundo*, which are by far the dominant *volunteer* woody stems counted or observed, are both native to southeastern Greene County and will not be removed. No other native woody stems that have colonized the restoration site will be removed, unless it's a necessary and unavoidable part of exotic invasive woody stem removal/management.

In areas with observed mortality in 2005, approximately 4,000 bare root saplings were planted during late January 2006. No problem areas were identified in 2006.

Browsing evidence was observed in a small number of monitoring units during 2006, but is much less common or threatening than in 2005. Threats to planted woody stem success from browsing will continue to be monitored, but the negative impact on stem success is expected to lessen as the trees age.

Table 1.1 Importance Values - Contentnea Creek/Little Contentnea Creek Riparian Buffer Restoration - Phase 2 - Greene County, NC

Species	Total Live Stems	Total Dead	Average Height (cm)	Average Height (feet)	Average Diameter (cm)	Relative Diameter (%)	Relative Density (%)	Importance Value
