1.0 EXECUTIVE SUMMARY/PROJECT ABSTRACT

The overall restoration strategy/approach was to restore and enhance the site through the use of pattern changes and in-stream structures that will provide grade control, enhance stability, promote efficient sediment transport, and produce/enhance in-stream habitat. A buffer was planted along the stream banks to help stabilize the banks. The buffer is also intended to enhance water quality through root filtration and shading, while also providing habitat for amphibians, reptiles, small mammals, and birds.

The goals of the project include:

- Reducing erosion from within the project study area.
- Restoring a channel that is able to properly transport watershed flows and sediment loads efficiently.
- Improving aquatic habitat.
- Enhancing wildlife habitat.
- Improving overall water quality.

The objectives of the proposed project include:

- Stabilizing eroding stream banks and headcuts.
- Restoring the stream channels to a proper dimension, pattern, and profile.
- Providing the stream channels with adequate flood prone area.
- Establishing a more diverse bed morphology with riffle-pool sequences supported by in-stream structures, and by providing a source for woody debris and leaf litter by planting a native riparian buffer.
- Creating riparian corridors.
- Reducing direct inputs of nutrients and fecal coliform by excluding livestock from the stream channels and providing livestock with alternative sources of drinking water.
- Reducing nutrient and sediment inputs to the stream from the agricultural fields by providing a native riparian buffer.

As an important part of this project, North Carolina Ecosystem Enhancement Program (NCEEP) contracted with the Buncombe Soil and Water Conservation District (SWCD) to prepare a Farm Conservation Plan that identified and implemented agricultural and livestock Best Management Practices (BMPs) important for improving water quality. The farm plan and associated BMPs are intended to address water quality issues along Newfound Creek and unnamed tributaries through practices such as livestock exclusion, stabilizing heavy use areas, and enabling alternative watering systems, which will all help to ensure the long-term success of the Newfound Creek Stream Restoration Project. This farm plan included BMPs related to livestock watering (21 tanks and 2 drilled wells), fencing (21,000 linear feet), and stock trails (4,000 linear feet). All installed BMPs meet the standards and specifications of either the US Department of Agriculture Natural Resources Conservation Service Technical Guide or the Soil and Water Conservation Commission standards.

The Newfound Creek Stream Restoration site is located off of Browntown Road in western Buncombe County, North Carolina, in the Newfound Community near the town of Leicester (Figure 1). Newfound Creek and its unnamed tributaries are located in the French Broad River Basin, US Geological Survey (USGS) cataloging unit 06010105, hydrologic unit 06010105090020, and NC Division of Water Quality (NCDWQ) subbasin 04-03-02. The total watershed area is 10.3 square miles and is characterized by steep slopes leading to a broad bottomland valley. The dominant land use in the watershed is forest, primarily on the surrounding ridges and steep slopes. As the slopes decrease, agricultural land uses increase. The majority of the valley floor has been cleared and is being used for agricultural and residential practices. The land uses directly adjacent to the project site are agricultural and residential. The conservation easement is bordered by agricultural fields that support beef cattle and row crops (mainly tomatoes). Prior to restoration, farming activities occurred right up to the streambank (including cattle access to the channel). Drainage ditches around the row crops discharged directly into Newfound Creek, and appeared to carry a large sediment load. Marjorie Lynn Brown owns all of the land bordering the conservation easement.

The project consists of a portion of Newfound Creek and six unnamed tributaries situated within 25.33 acres of Permanent Conservation Easement held by the State of North Carolina. The restored portion of Newfound Creek and six unnamed tributaries total 11,020 linear feet (Figure 2). The tributaries identified for this project are designated as: Tributary 3, Tributary 4, Tributary 5, Tributary 6, Tributary 7, and Tributary 8. Tributaries 3 through 6 and 8 flow directly into Newfound Creek. Tributary 7 flows into Round Hill Branch upstream of its confluence with Newfound Creek. The stream restoration project design was broken into 29 reaches (Figure 3). The six unnamed tributaries and mainstem (upstream and downstream of Newfound Road) will be used for monitoring purposes.

Tributaries 1 and 2 are located on an adjacent property and were initially considered for inclusion in the project. These tributaries were subsequently dropped from the project and do not enter the current Project Study Area. The original numbering of tributaries used in the early stages of project development has been maintained throughout the life of the project for consistency.

2012 Monitoring Year (MY) 1 monitoring indicates that the planted woody vegetation is doing fair at the site. The site-wide average stem count is 431 stems/acre. Four of the 14 planted plots are not meeting the success criteria of 320 stems/acre at MY3 (plots 2, 4, 6, and 12). Two of the plots are barely meeting the criteria (plots 5 and 7). The streamside and floodplain zones are generally in better health than upland areas. Tributaries with steep slopes seem to be the most problematic. For example, the slopes along Tributary 8 are generally in poor condition and appear to support only herbaceous growth. Streamside survival appears to be the most successful. The banks of some of the smaller tributaries have filled in with a dense mat of Juncus. This is most notable within Tributary 4, Reach B and G and Tributary 7, Reach B.

Chinese privet (*Ligustrum sinense*) was noted along Tributaries 4 and 5. While it is not problematic at this time, left untreated, it may encroach the entire site. The presence and abundance of privet will be monitored each year and any notable changes will be documented.

In MY1 the Newfound Creek Stream Restoration project is functioning well and has continued to improve and evolve since construction. The majority of the bed features appear stable with well-developed pools in the meander bends and long riffles in the straight reaches. Structures appear to be holding grade throughout the project. The main channel does have a few areas of raw bank that have been noted for future re-assessment.

Overall, the site is doing well. The fences that were constructed to exclude cattle are all in good condition. It was noted that the cross lines at the upper crossing on the mainstem at station 3+25 were down and the gate was open at the time of the field survey. However, no evidence of cows within the easement was observed. It appeared as if the adjacent pasture was no longer used for grazing.

Summary information/data related to the occurrence of such things as beaver or encroachment, and statistics related to performance of various project and monitoring elements can be found in the Newfound Creek Stream Restoration Mitigation Report (2012) and in the Mitigation Plan (formerly the Restoration Plan) documents available on EEP's website. All raw data supporting the tables and figures in the appendices are available from EEP upon request.

2.0 METHODOLOGY

All monitoring methodologies follow the June 2012 *Procedural Guidance and Content Requirements for EEP Monitoring Reports* provided by EEP (EEP 2012). Photographs were taken at high resolution using a Nikkon Coolpix 8.0 megapixel digital camera. Coordinate information was collected in 2012 during the As-Built survey using a Topcon GTS 225 Total Station by Kee Mapping and Surveying. Stream and vegetation problem areas were noted in the field on As-Built Plan Sheets (URS 2012). Permanent photo station photographs were taken from locations established during initial monitoring set-up, recorded by Kee Mapping and Surveying, and are shown on As-Built Plan Sheets.

2.1 STREAM METHODOLOGY

The methods used to generate the data in this report are standard fluvial geomorphology techniques as described in *Applied River Morphology* (Rosgen 1996) and related publications from US Forest Service and the interagency Stream Mitigation Guidelines (USACE 2003). URS' field morphology survey was conducted using a VRS Total Station and the data were analyzed and displayed using the Reference Reach Spreadsheet, Version 4.2T (Mecklenburg 2006). The entirety of the Newfound Creek Stream Restoration site was surveyed during MY 1. A total of 10,388 linear feet of survey was conducted across the eight reaches. Newfound Creek upstream of Browntown Road included 2,587 linear feet; Newfound Creek downstream of Browntown Road included 2,516 linear feet; Tributary 3 included 1,204 linear feet; Tributary 4 included 1,911 linear feet; Tributary 5 included 630 linear feet; Tributary 6 included 732 linear feet; Tributary 7 included 430 linear feet, and Tributary 8 included 378 linear feet. The longitudinal stationing was taken directly from the VRS Total Station data. Pebble counts were conducted by sampling a total of 100 pebbles from the feature of the cross section (the entire riffle or pool). According to the most recent guidance issued in Rosgen courses, the pebble count was concentrated within the wetted perimeter of the channel and did not include the banks. Photographs were taken at each of the 28 cross sections. A photo was taken from the left bank towards the right bank and from the right bank towards the left bank. Bankfull curve

relationships were derived from *Bankfull Hydraulic Geometry Relationships for North Carolina Stream* (Harmon *et al* 1999).

2.2 VEGETATION METHODOLOGY

According to the 2008, Version 4.2 CVS-EEP Protocol for Recording Vegetation (Lee *et al* 2008), the Newfound Creek Stream Restoration Project requires the monitoring of 14 vegetation plots. These plots were established during initial monitoring set-up in 2012 and are shown on the As-Built Plan Sheets.

Vegetation monitoring methods followed the 2008, Version 4.2 CVS-EEP Protocol for Recording Vegetation (http://cvs.bio.unc.edu/methods.htm). Vegetation plot photographs were collected at the southwest corner of each vegetation plot. Vegetation monitoring plots were re-marked in the field by replacing all old flagging with new flagging. URS placed orange flagging at the southwest corner of each vegetation plot and blue flagging at the remaining corners. Planted stems were flagged in white. Volunteer/natural regeneration stems were inventoried, but not flagged. Monitoring taxonomy follows 'Flora of the Carolinas, Virginia, Georgia, and Surrounding Areas' (Weakley 2007). Stem height was measured with a folding one-meter rule. Diameter at breast height (when applicable) was measured with calipers.

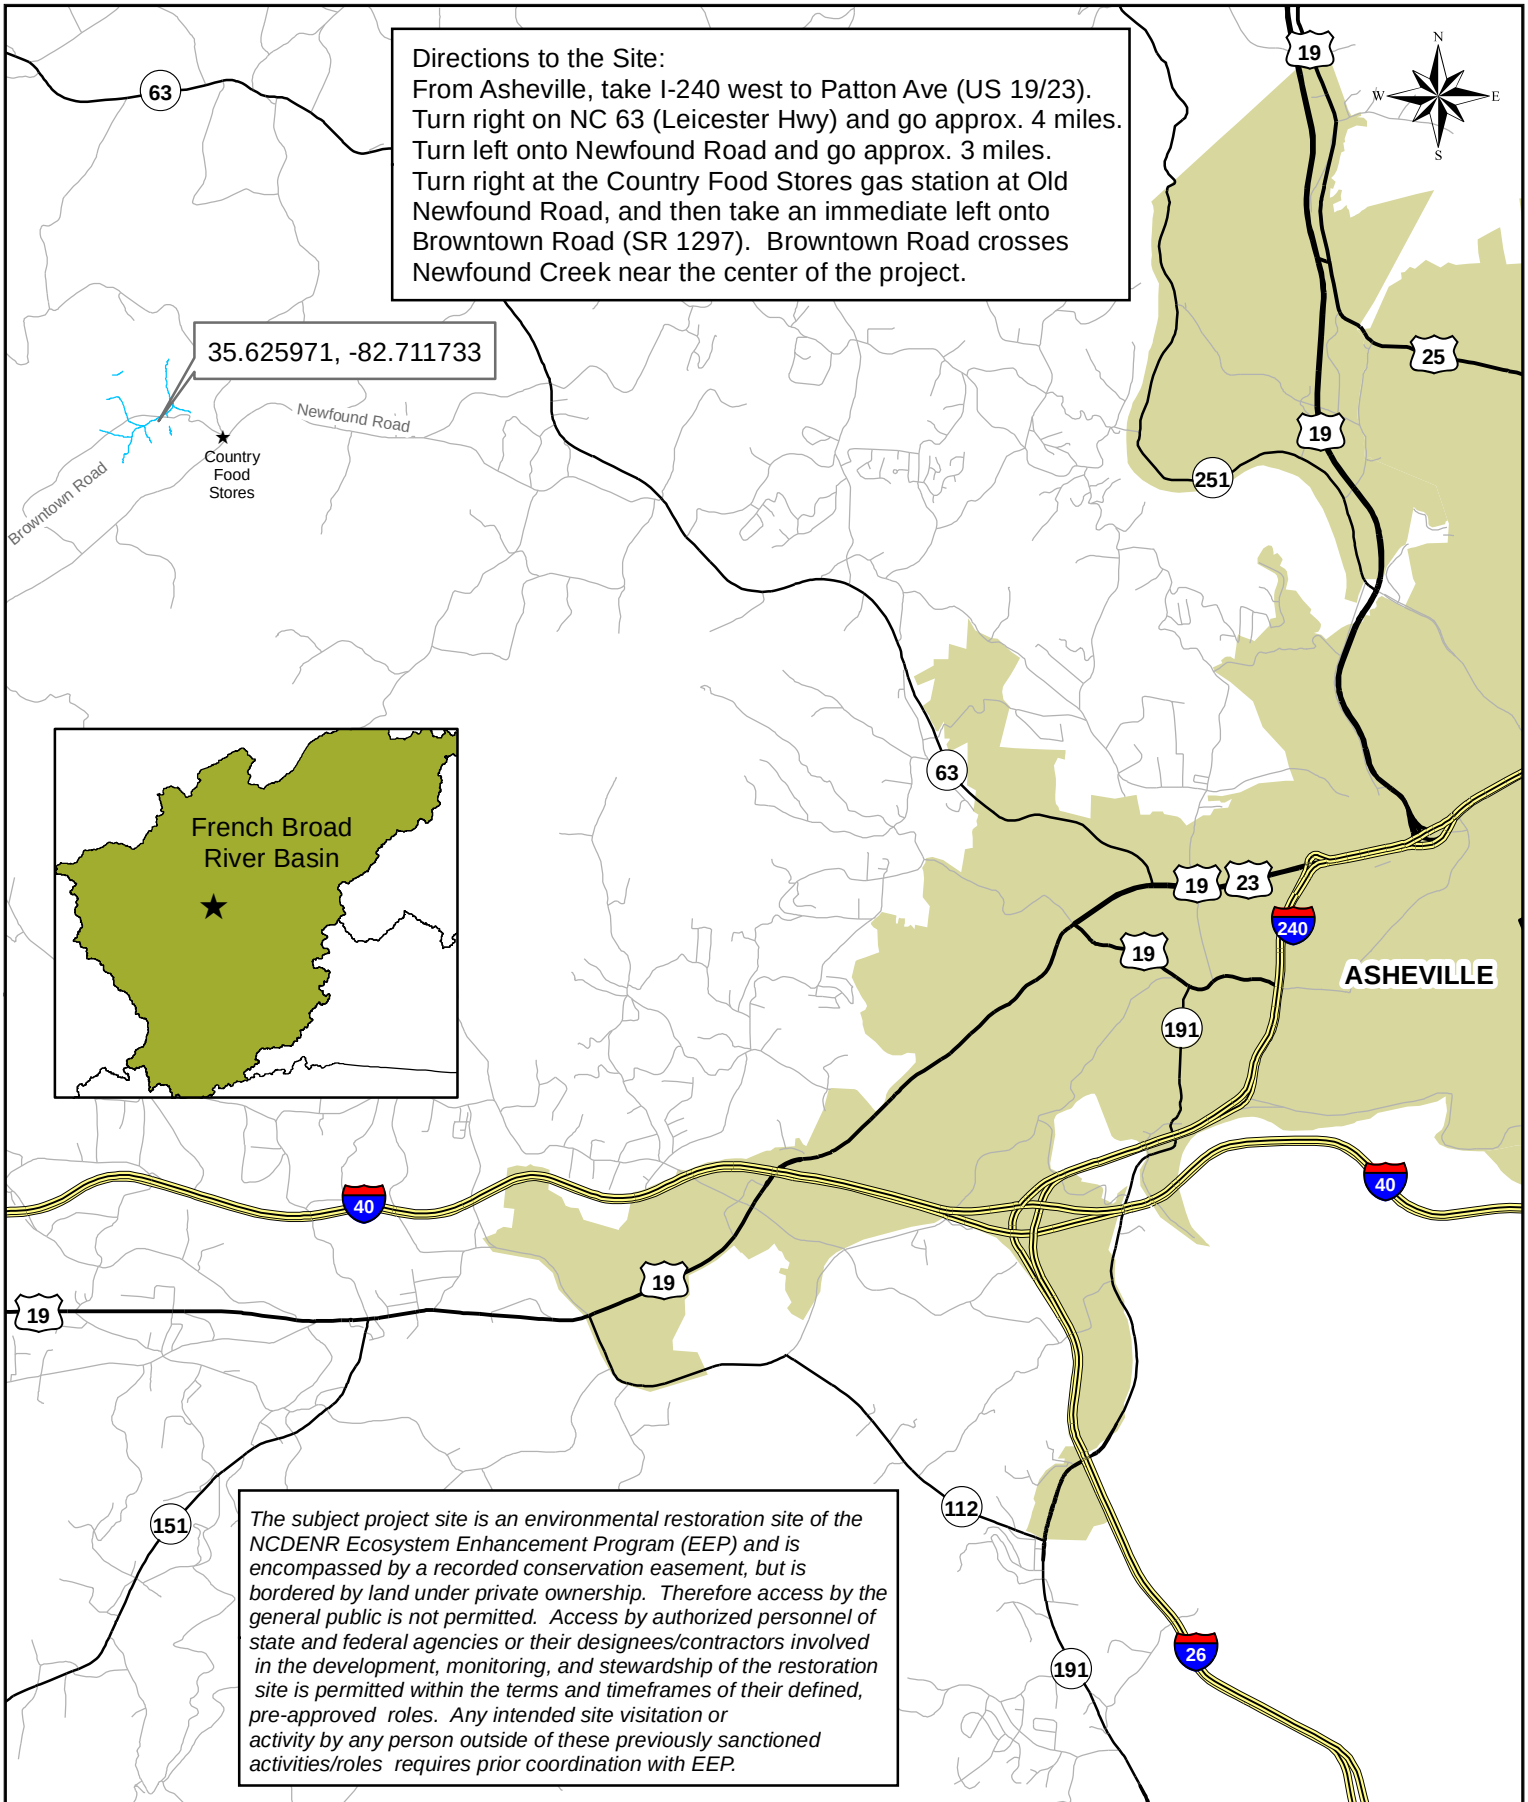
Appendices for Project Background, Condition, and Performance Data

Appendix A: Project Vicinity Map and Background Tables



The subject project site is an environmental restoration site of the NCDENR Ecosystem Enhancement Program (EEP) and is encompassed by a recorded conservation easement, but is bordered by land under private ownership. Therefore access by the general public is not permitted. Access by authorized personnel of state and federal agencies or their designees/contractors involved in the development, monitoring, and stewardship of the restoration site is permitted within the terms and timeframes of their defined, pre-approved roles. Any intended site visitation or activity by any person outside of these previously sanctioned activities/roles requires prior coordination with EEP.

Length of Reach (linear feet)	2,090	2,320	1,047	1,757	675	678	480	687
Valley Classification	VIII	VIII	VIII	II	II	VIII	VIII	VIII
Drainage Area (acres)	6,620		70	70	45	51	32	26
NCDWQ Stream Identification Score	44		31.5	33.5	40.5	38	33	32.5
NCDWQ Water Quality Classification	C	C	C	C	C	C	C	C

Parameters	Mainstem Part I	Mainstem Part II	Tributary 3	Tributary 4	Tributary 5	Tributary 6	Tributary 7	Tributary 8
Morphological Description (stream type)	C4/1	B4/1	G5/F5	A5/G5/B5/E 5	E4b/G4/B4 /E4	B4/E5	E5	G5/E5
Evolutionary Trend	C–>C	B->C	G/F->B	A/G/B/E->E	E/G/B/E- >Eb	B/E->E	E->E	G/E->E
Underlying Mapped Soils	French Loam, 0-3%	French Loam, 0-3%	Tate Loam 2-8%	Evard-Cowee Complex 30-50%	Evard-Cowee Complex 30-50%	Tate Loam 2-8%	Tate Loam 8-15%	Tate Loam 8-15%
Drainage Class	Somewhat Poorly	Somewhat Poorly	Well Drained	Well Drained	Well Drained	Well Drained	Well Drained	Well Drained
Soil Hydric Status	Hydric B	Hydric B	Non-Hydric	Non-Hydric	Non-Hydric	Non-Hydric	Non-Hydric	Non-Hydric
Slope	0.0076	0.0054	0.024	0.0373	0.0625	0.0387	0.0416	0.0499
FEMA Classification	Detailed Study	Detailed Study	N/A	N/A	N/A	N/A	N/A	N/A
Native Vegetation Community	Agriculture	Agriculture	Agriculture	Agriculture/ Livestock pasture grass	Forest/ Livestock pasture grass	Agriculture/ Livestock pasture grass	Livestock pasture grass	Livestock pasture grass

Wetland Summary Information

Parameters	Wetland A	Wetland B/C
Size of Wetland (acres)	0.26	0.44
Wetland Type (non-riparian, riparian riverine or riparian non-riverine)	Riparian Riverine	Riparian Riverine
Mapped Soil Series	Tate Loam, 8-15%	Tate Loam, 8-15%
Drainage Class	Very Deep, Well Drained	Very Deep, Well Drained
Soil Hydric Status	Non-Hydric	Non-Hydric
Source of Hydrology	Seep	Stream Channel
Hydrologic Impairment	None	Pond Berm

Native Vegetation Community	Scrub-Shrub	Emergent	
Percent Composition of Exotic Invasive Vegetation	U	U	
Regulatory Considerations			
Regulation	Applicable?	Resolved?	Supporting Documentation
Waters of the United States - Section 404	Yes	Jul-07	Restoration Plan
Waters of the United States - Section 401	Yes	Feb-07	Restoration Plan
Endangered Species Act	Yes	Jul-07	Restoration Plan
Historic Preservation Act	Yes	Jul-07	Restoration Plan
Coastal Zone Management Act (CZMA)/Coastal Area Management Act (CAMA)	N/A	N/A	N/A
FEMA Floodplain Compliance	Yes	Ongoing	LOMR submitted November 2012
Essential Fisheries Habitat	Yes	Jan-07	Restoration Plan

Table 5a: Visual Stream Morphology Stability Assessment Table – Tributary 3

Newfound Creek Stream Restoration EEP Project Number 92497										
Reach ID - Reach 3 - Tributary 3										
Assessed Length - 1204										
Major Channel Category	**Channel Sub-Category**	**Metric**	**Number Stable, Performing as Intended**	**Total Number in As-built**	**Number of Unstable Segments**	**Amount of Unstable Footage**	**% Stable, Performing as Intended**	**Number with Stabilizing Woody Vegetation**	**Footage with Stabilizing Woody Vegetation**	**Adjusted % for Stabilizing Woody Vegetation**
1. Bed	1. **Vertical Stability** (Riffle and Run units)	1. Aggradation - Bar formation/growth sufficient to significantly deflect flow laterally (not to include point bars)			0	0	100%			
		2. Degradation - Evidence of downcutting			0	0	100%			
	2. Riffle Condition	1. Texture/Substrate - Riffle maintains coarser substrate	19	19			100%			
	3. Meander Pool Condition	1. Depth Sufficient (Max Pool Depth : Mean Bankfull Depth ≥ 1.6)	15	15			100%			
		2. Length appropriate (>30% of centerline distance between tail of upstream riffle and head of downstrem riffle)	15	15			100%			
	4.**Thalweg Position**	1. Thalweg centering at upstream of meander bend (Run)	15	15			100%			
		2. Thalweg centering at downstream of meander (Glide)	15	15			100%			

2. Bank	**1. Scoured/Eroding**	Bank lacking vegetative cover resulting simply from poor growth and/or scour and erosion			0	0	100%	0	0	100%
	2. Undercut	Banks undercut/overhanging to the extent that mass wasting appears likely. Does NOT include undercuts that are modest, appear sustainable and are providing habitat.			0	0	100%	0	0	100%
	3. Mass Wasting	Bank slumping, calving, or collapse			0	0	100%	0	0	100%
				Totals	0	0	100%	0	0	100%
3. Engineered Structures	**1. Overall Integrity**	Structures physically intact with no dislodged boulders or logs.	9	9			100%			
	2. Grade Control	Grade control structures exhibiting maintenance of grade across the sill.	5	5			100%			
	2a. Piping	Structures lacking any substantial flow underneath sills or arms.	8	8			100%			
	3. Bank Protection	Bank erosion within the structures extent of influence does not exceed 15%. (See guidance for this table in EEP monitoring guidance document)	9	9			100%			
	4. Habitat	Pool forming structures maintaining ~ Max Pool Depth : Mean Bankfull Depth ratio ≥ 1.6 Rootwads/logs providing some cover at base-flow.	8	8			100%			

Table 5b: Visual Stream Morphology Stability Assessment Table – Tributary 4

Appendix E: Hydrology Data

Table 13: Verification of Bankfull Events

Newfound Creek Stream Restoration EEP Project Number 92497			
Date of Data Collection	Date of Occurrence	Method	Photo # (if available)
02/06/13 & 02/07/13	Unknown	Site photographs (wrack lines)	44, 177, 183
02/26/13	Approx. January 15 and January 28, 2013	Proximal USGS gauge resource – Pigeon River	Figure 23
02/26/13	Approx. January 15 and January 28, 2013	Proximal USGS gauge resource – Ivy River	Figure 24

Two crest gauges were installed along the mainstem of the site on February 7, 2013. One is located upstream of Browntown Road, and one is located downstream of Browntown Road. Crest gauges will be checked during site assessments each spring and during monitoring events each fall.

Potential bankfull occurrences for the past year (January 31, 2012 to January 31, 2013) were extrapolated based on USGS stream gauge discharge data for the Pigeon River near Hepco, NC (03459500) and the Ivy River near Marshall, NC (03453000). The USGS gauge plots are shown below (Figures 23 & 24). The Pigeon River gauge is located in Haywood County and has a drainage area of 350 square miles. The Ivy River gauge is located in Madison County and has a drainage area of 158 square miles.

An estimate of the number of bankfull events between January 31, 2012 and January 31, 2013 was made by comparing the stream discharges from the USGS data in cubic feet per second (cfs) against the bankfull discharge estimated from the drainage area on the Mountain Regional Curve. According to the regional curve, a bankfull event occurs on a stream with a 350 square mile drainage area when the discharge is about 10,000 cfs. This discharge was reached twice during the past year at the Pigeon River location – once on or around January 15, 2013 and again on or around January 28, 2013. A bankfull event occurs on a stream with a 158 square mile drainage area when the discharge is about 4,000 cfs. This discharge was reached twice during the past year at the Ivy River location – once on or around January 15, 2013 and again on or around January 28, 2013. Data are consistent between gauges.

Rainfall data are presented in Figure 25.
