## EXECUTIVE SUMMARY

The North Carolina Ecosystem Enhancement Program (EEP) has facilitated the restoration of Hatchet's Grove Tributary and an unnamed tributary to Hatchet's Grove (Meadow Creek). Soil and Environmental Consultants, PA (S&EC) designed the restoration. The watershed of approximately 3.7 square miles is located within USGS 14-digit HUC 03020201080010 and NCDWQ Sub-basin 03-04-02 of the Neuse River Basin. The restoration proposed to restore approximately 4,123 linear feet of channel, 3,828 feet on Hatchet's Grove and 295 feet on Meadow Creek and 5.3 acres of riparian buffer. The restoration was designed to correct various problems with the existing stream corridor including channelization and poor vegetation maintenance practices. The restoration construction was completed in 2004, and first year monitoring took place in 2005. This report is a description of the findings of the second year monitoring that took place in 2006.

The riparian buffer zone was planted with 16 different species of trees and shrubs. The bankfull channel area was live staked with three (3) different species. The vegetation monitoring plots were established during the as-built survey. Three buffer plots and three stream bank plots were established. For the second year monitoring, the EEP changed the vegetation monitoring protocol for this project. The new protocol required that the three stream bank plots be repositioned. The three new plots were established during the second year monitoring and all six of the plots were assessed using the new monitoring protocol. The second year monitoring counted an average of 715 stems per acre in the riparian buffer. There were no major problems with exotic / invasive plants. The only vegetation problem areas were a few patches of bare floodplain and bare banks. There are also two areas where the riparian buffer has been mowed almost to the streambanks. These problem areas are depicted in Appendix A, on the Vegetation Problem Area Plan View. The first year monitoring found the vegetation component of the project to be successful.

The physical monitoring of the stream's dimension and profile consisted of an entire longitudinal profile of both Hatchet's Grove and Meadow Creek, and two cross-sections on Meadow Creek and six cross-sections on Hatchet's Grove. The stream assessment completed during the first year monitoring found the stream to have numerous problems with streambank erosion and floodplain scour. The second year monitoring documented many of these same problems, with some previous problems stabilizing and some worsening. While parts of the stream appear to have stable dimensions, some of the streambank erosion is severe enough to warrant timely attention and possible maintenance/remediation. The second year monitoring profile shows large elevation differences from the as-built profile. There is not the same profile-wide elevation difference in comparison to the first year monitoring profile, but there is a mix of local aggradation and degradation throughout the profile. These issues are detailed in the following report and should be closely monitored to determine if corrective actions are warranted.

## **1.0 PROJECT BACKGROUND**

### **1.1 Project Objectives**

- Develop a channel with the appropriate dimension, pattern, and longitudinal profile utilizing the existing channel condition survey and collected reference reach data as a guide.
- Improve and create bed form diversity (riffles, runs, pools, and glides).
- Construct a floodplain (bankfull bench) that is accessible at the proposed bankfull channel elevation (Priority II restoration).
- Ensure channel and stream bank stabilization by integrating grade control structures, root wads, and native vegetation in conjunction with the eradication or modification of current grounds maintenance practices.
- Establish a 30-foot native riparian plant community, when possible, from the edge of the restored reach.
- Integrate existing golf course uses with the proposed restoration plan providing aesthetic and education values.

### **1.2 Project Structure, Restoration Type, and Approach**

Previously incised channels through the Prestonwood Golf Course, Hatchet's Grove and Meadow Creek were restored using channel dimension and profile modifications and the establishment of a vegetated riparian zone adjacent to the streams. Channel profile is maintained through the use of rock cross vanes. Channel pattern is maintained through the use of single vanes, root wads, and vegetation along the channel banks.

### **1.3 Location and Setting**

The Prestonwood site is located on a golf course, which is surrounded by apartments and single family homes. Areas of forested and agricultural land are sporadically spaced throughout the watershed. Development pressure will continue to urbanize the watershed, increasing the amount of impervious areas.

### **1.4 Project History and Background**

**Table 1. Project Mitigation Structure and Objectives**

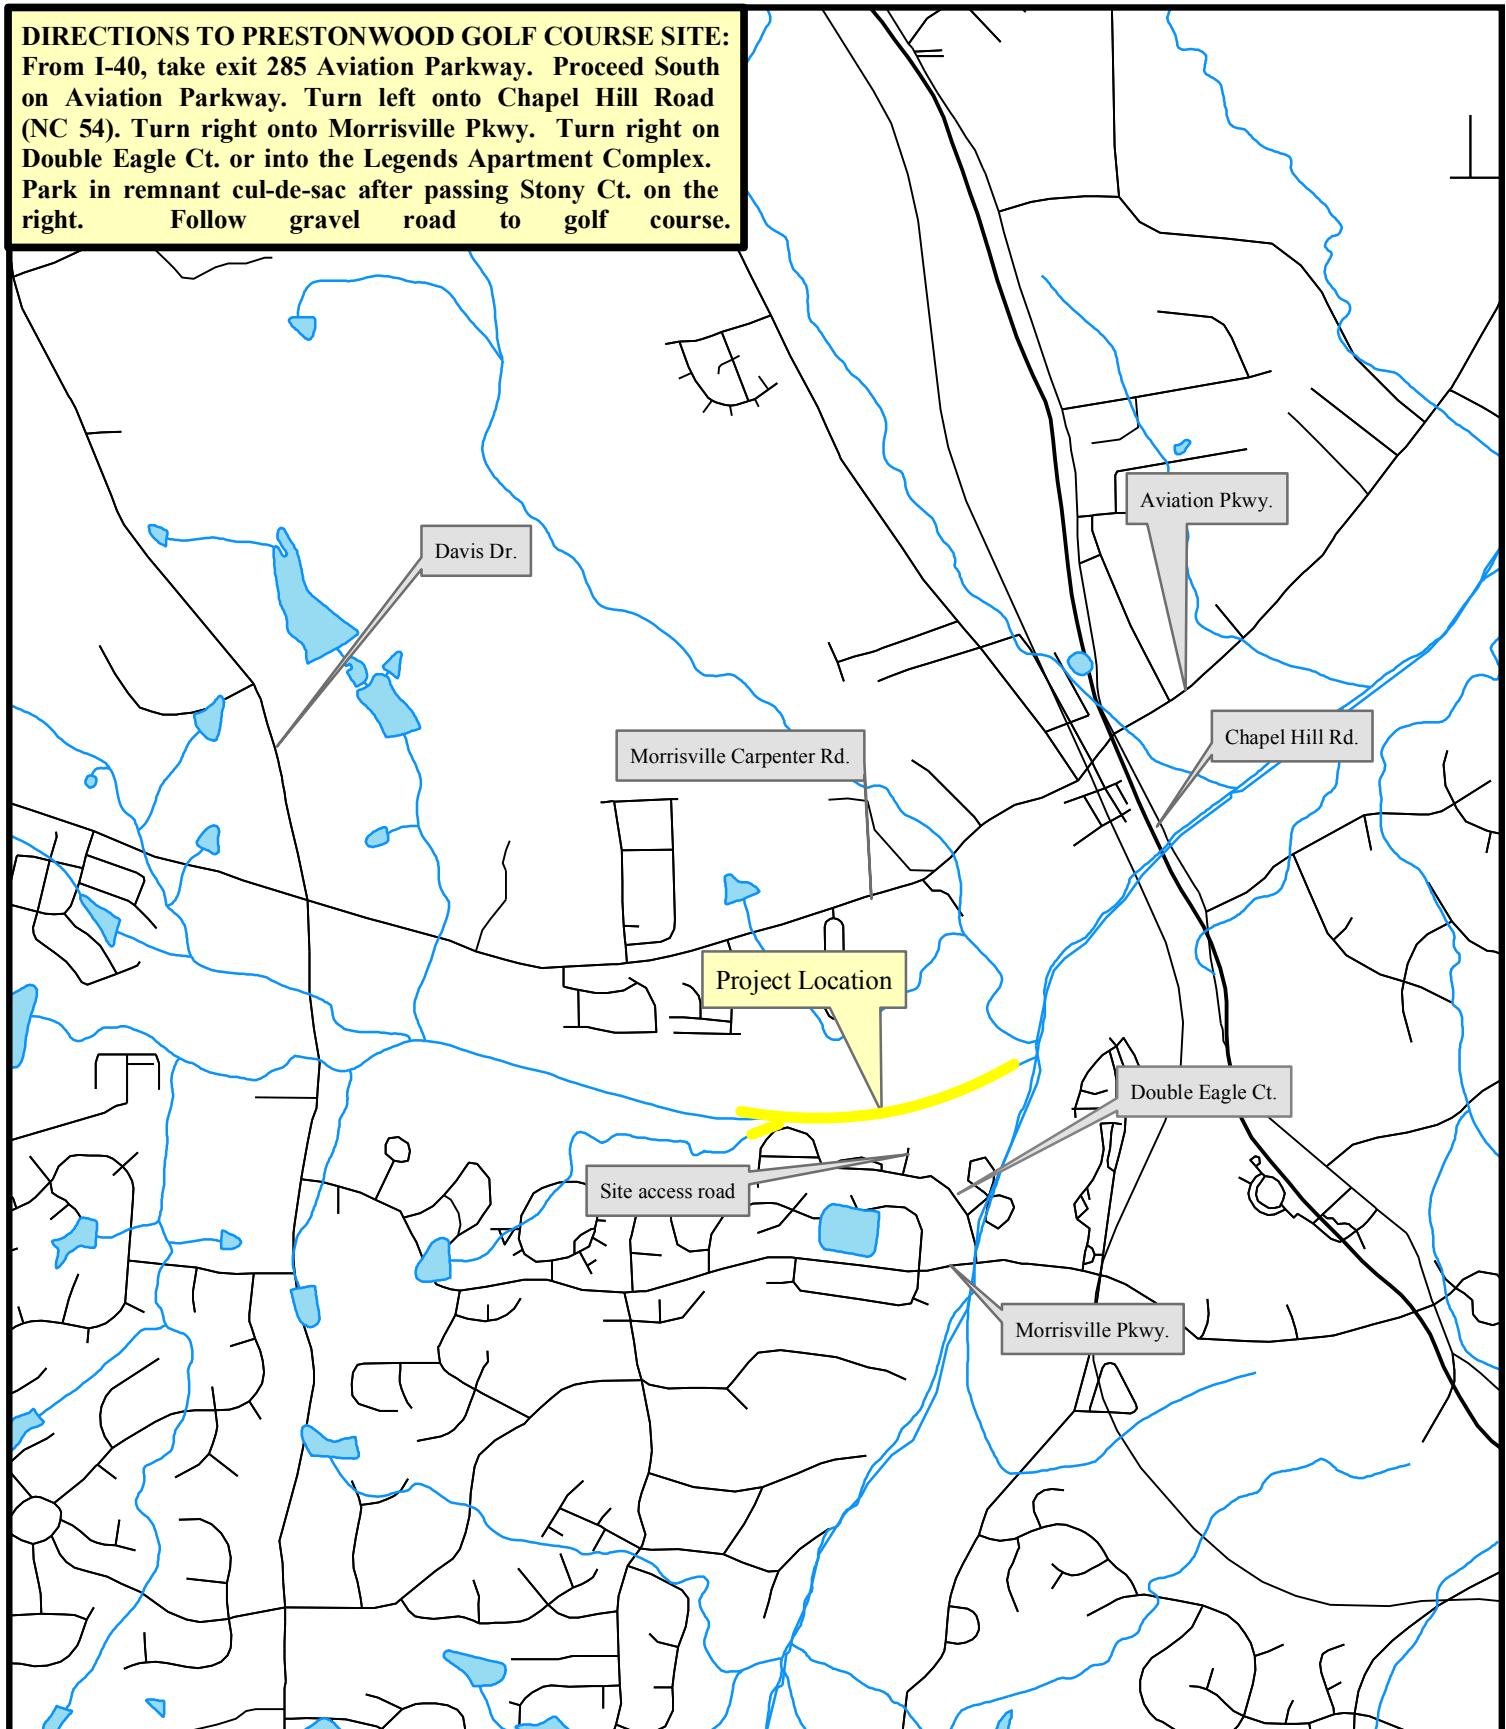

**Project Number and Name: 289 – Prestonwood Golf Course (Hatchet's Grove)**

Segment / Reach ID	Existing Linear Feet	Type	Approach	Linear Feet	Mitigation Ratio	Mitigation Units	Stationing	Comment

P2 = Priority II

**DIRECTIONS TO PRESTONWOOD GOLF COURSE SITE:**  
From I-40, take exit 285 Aviation Parkway. Proceed South on Aviation Parkway. Turn left onto Chapel Hill Road (NC 54). Turn right onto Morrisville Pkwy. Turn right on Double Eagle Ct. or into the Legends Apartment Complex. Park in remnant cul-de-sac after passing Stony Ct. on the right. Follow gravel road to golf course.

The plots have been renumbered according to the new vegetation monitoring protocol. There are now six plots at the site, three of these are the buffer monitoring plots that were set up for first year monitoring, and three are new plots that were set up for second year monitoring. For comparison to the first year monitoring report, the new plot 1 is the same as the first year plot 1, the new plot 3 is the same as the first year plot 2, and the new plot 6 is the same as the first year plot 3. Comparison between monitoring years of these three plots reveals that; plot 1 has the same number of stems, but the species distribution is different; plot 3 has the same species, but reveals less than 50% survival; in plot 6 the number of stems was under reported for the first year and the distribution of species has also changed. The third year of monitoring will provide a better assessment of the survivability of the vegetation in the plots because of consistency in monitoring and reporting.

**Table A6a. Vegetative Problem Areas****Project Number and Name: 289 – Prestonwood Golf Course (Hatchet’s Grove)****Segment/Reach: Hatchet’s Grove (3,828 ft.)**

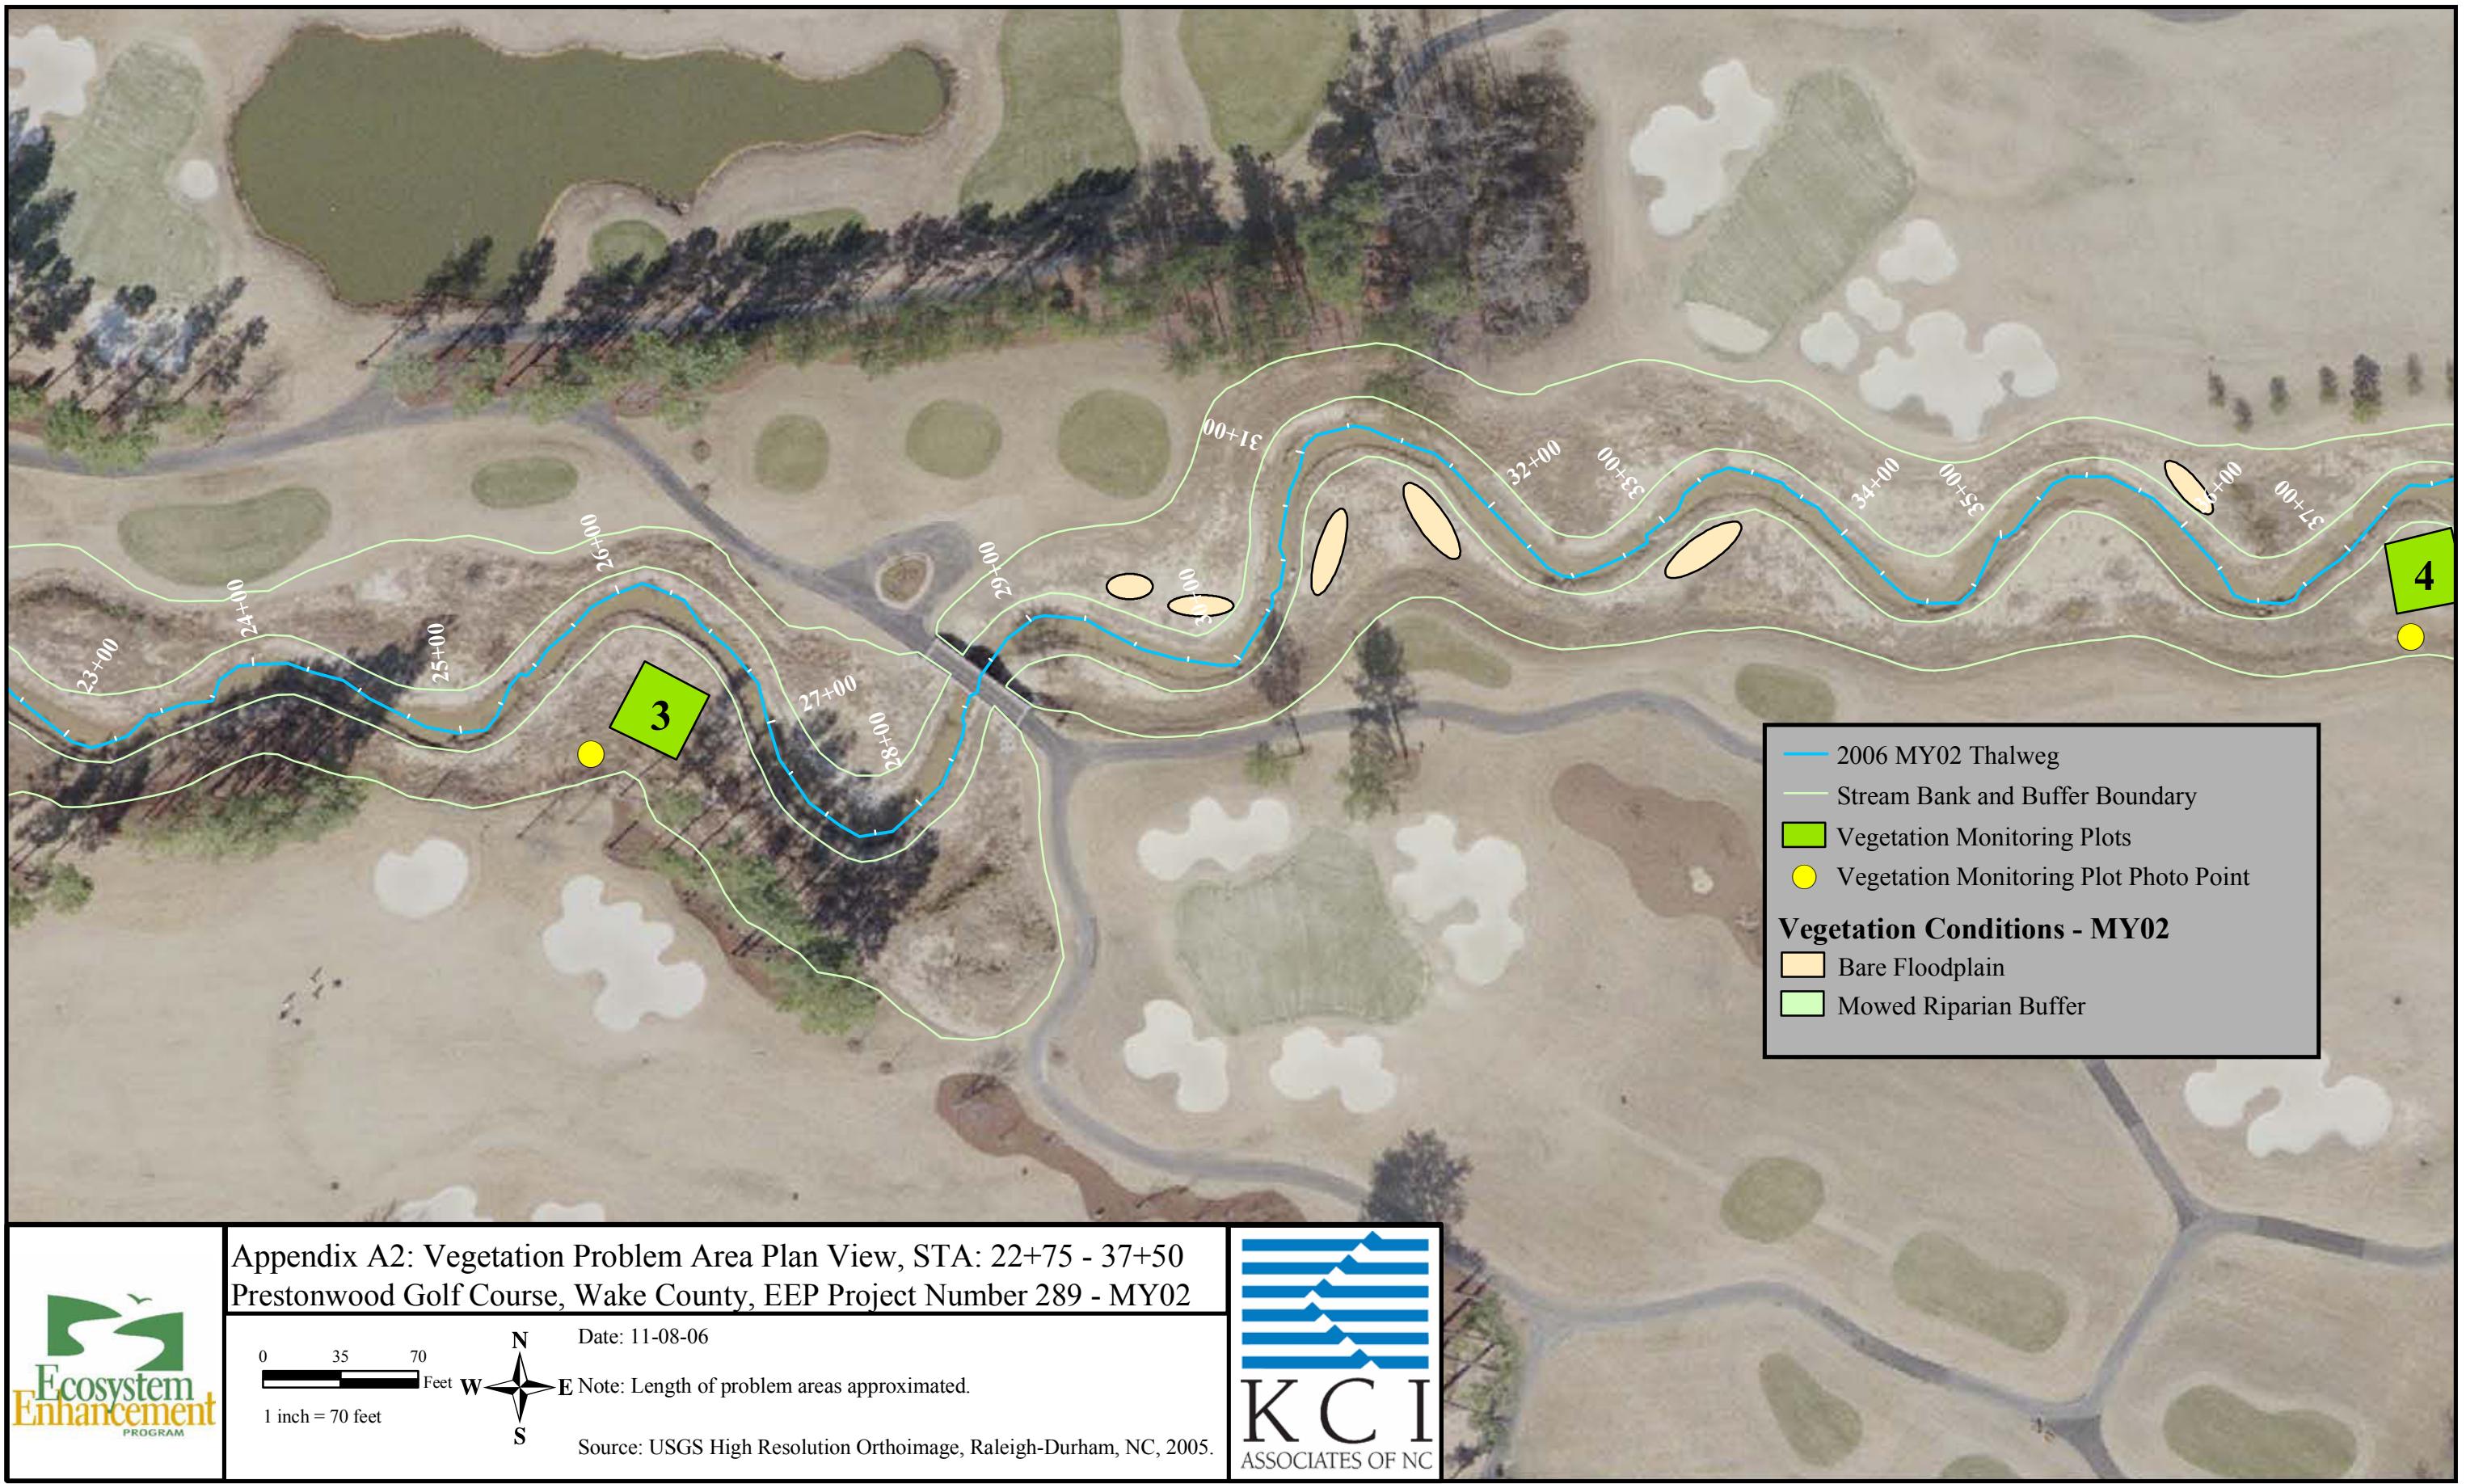

<b>Feature/Issue</b>	<b>Station # / Range</b>	<b>Probable Cause</b>	<b>Photo #</b>

Mowed Riparian Buffer	00+00 – 01+50	Golf course maintenance	VP3

It should be noted that the areas called out in App B2, the Stream Problem Area Table, as bank scour are raw banks and therefore devoid of vegetation. This can be seen in the representative photos for those problem areas.

	upstream of STA 00+00	beavers	SP8

The primary problem facing the Hatchet's Grove stream are extended areas of severe bank erosion. While the specific cause of the bank erosion is unknown, the radius of curvature applied to many of the meanders appears to be too small for this suburban watershed, causing instability throughout the meanders. These eroded banks should be closely monitored to determine if corrective actions are warranted. Floodplain conditions along the stream varied in terms of erosion and deposition. Between stations 10+00 and 28+00 the floodplain shows signs of aggradation as sand has been deposited on the floodplain during high flow events, see SP5. From station 28+00 to 39+00, the floodplain has eroded creating the bare areas shown in Appendix A2 and areas of floodplain scour as listed above. Most of the floodplain scour appears to have occurred immediately following construction, before vegetation stabilized the floodplain surface. These areas were reevaluated during the second year monitoring and they appear to be stabilizing as vegetation cover becomes more prominent. The lower third of the stream appears to have a stable floodplain. No significant aggradation or degradation was noted during the second monitoring year.

The Monitoring Plan View illustrates how the cross vanes are located at the beginning of tangent sections (heads of riffles) on the stream planform. The action of the cross vane concentrates flow in the center of the channel and can induce scour. This action helps to maintain pools. The arms also slow water in the near bank region before redirecting it. The placement of the structures in their current location likely had a negative/adverse impact on the bed stability of the restored channel in these areas. Hence, the cross vanes on Hatchet's Grove stream act as grade controls, but also promote the formation of pools where riffles should be beginning. The cross vane arms do not extend up to the bankfull elevation or angle out away from the center boulder. Instead of directing water away from the banks the vane arms act as large stone toe bank protection. Because of the cross vane placement they have been evaluated primarily as grade control measures and stone toe stabilization, in which case most are functional.

## **App B3 – Representative Stream Problem Area Photos**

SP1 – Bank erosion. Photo taken near station 18+75. 11/5/06 - MY 02

SP2 – Severe bank erosion and floodplain scour. Photo taken near station 14+75, looking down on an eroded bank and a scour hole in the floodplain. 11/5/06 - MY 02

SP3 – Scour around rootwad. Vegetation and coir matting partially obscure the erosion behind the rootwad.  
Photo taken near station 29+10. 11/5/06 - MY 02

SP4 – Rock from cross vane has moved and bank has eroded behind cross vane arm. Photo taken near station 16+50. 11/5/06 - MY 02

SP5 – Beaver dam. Photo taken near station 39+45. 11/5/06 - MY 02

SP6 – Bank erosion. Photo taken near station 00+75. 11/5/06 - MY 02

SP7 – Back scour around rootwad and bank erosion. Rootwad partially obscured by coir matting. Photo taken near station 02+10. 11/5/06 - MY 02

SP8 – Beaver dam. Photo taken upstream of station 00+00, looking downstream. 11/5/06 - MY 02

## **App B4 – Stream Photo Station Photos**

Photo Point 1 – Taken looking upstream from golf cart bridge at the upper 300 feet of the Hatchet's Grove.  
11/5/06 - MY 02

Photo Point 2 – Taken looking downstream from golf cart bridge at the lower 300 feet of the Hatchet's Grove.  
11/5/06 - MY 02

## App B5 – Qualitative Visual Stability Assessment

**Table B2. Qualitative Visual Stability Assessment**

**Project Number and Name: 289 – Prestonwood Golf Course (Hatchet's Grove)**

**Segment/Reach: Hatchet's Grove (3,828 ft.)**
