I. Executive Summary/Project Abstract

This report represents monitoring year 3 for the Purlear Creek Phase I stream restoration project in Wilkes County, North Carolina. The project is comprised of six reaches (Reach 1 – 6).

The channel has remained stable since construction. Study reaches show no significant bed profile or channel pattern changes. Channel cross sections are stable and remain similar to as built conditions, except for a decrease in bankfull area in the Reach 1, Reach 2, and Reach 4 pool cross sections and Reach 2 riffle cross section. Sediment load from upstream sources is the likely cause. The majority of channel banks are well-covered with vegetation. Planted trees and shrubs are doing well throughout the buffer.

The primary area of concern from previous monitoring years is the grade drops at several of the cross vanes on the project. The majority of these vanes are no longer considered problem areas as dense vegetation has established along the vane arms, reducing the risk of piping or undermining. No action is recommended at this time but these structures should be monitored closely in upcoming monitoring events. Other concern areas are primarily small erosional areas that appear to be localized.

No immediate action is recommended for problem areas.

Vegetation is generally successful at Purlear Phase I. In 2007, the lower reaches showed low flow and dry conditions on the terrace, with reduced herbaceous growth compared to previous years. However, planted stem survival between 2006 and 2007 was 95% in plots, and surviving planted stem density can be extrapolated from the 25 plots and estimated at 1068 planted stems per acre. Most trees were unaffected by cattle at the time of monitoring, but trees are at risk from repeated cattle incursions into the buffer. Trampling, manure, and grazing effects from individual cattle were sporadically in evidence throughout the upper half of the project. A few meters of electric fencing were trailing on the ground just downstream of the bridge halfway through the project, and a cow was observed inside the buffer during monitoring.

II. Project Background

Project background information can be obtained from the as-built monitoring report prepared by Kimley-Horn and Associates dated 2004.

Table I lists project structure and objectives while Table II lists project activity and reporting history. The project contact table is listed in Table III and Table IV lists the background information for the project. Figure 1 shows a map with detailed directions to the project site.

**Table I. Project Mitigation Structure and Objectives
Purlear Creek Phase I / Project # 294**

Project Segment or Reach ID	Mitigation Type	Approach	Linear Footage or Acreage	Monitoring Stationing*	Comment
Reach 1 - Upper Main Reach	R	P1	2,260 lf	-0+50 to 10+00	From Channel start to confluence with Upper Middle Tributary
Reach 2 - Upper Middle Tributary	R	P1	1,340 lf	0+00 to 2+60	
Reach 3 - Middle Main Reach	R	P1	2,850 lf	0+00 to 7+00	From confluence with Upper Middle Tributary to confluence with Lower Middle Tributary
Reach 4 – Lower Middle Tributary (upper reach)	R	P1	700 lf	0+00 to 6+50	From start of Lower Middle Tributary to first culvert crossing

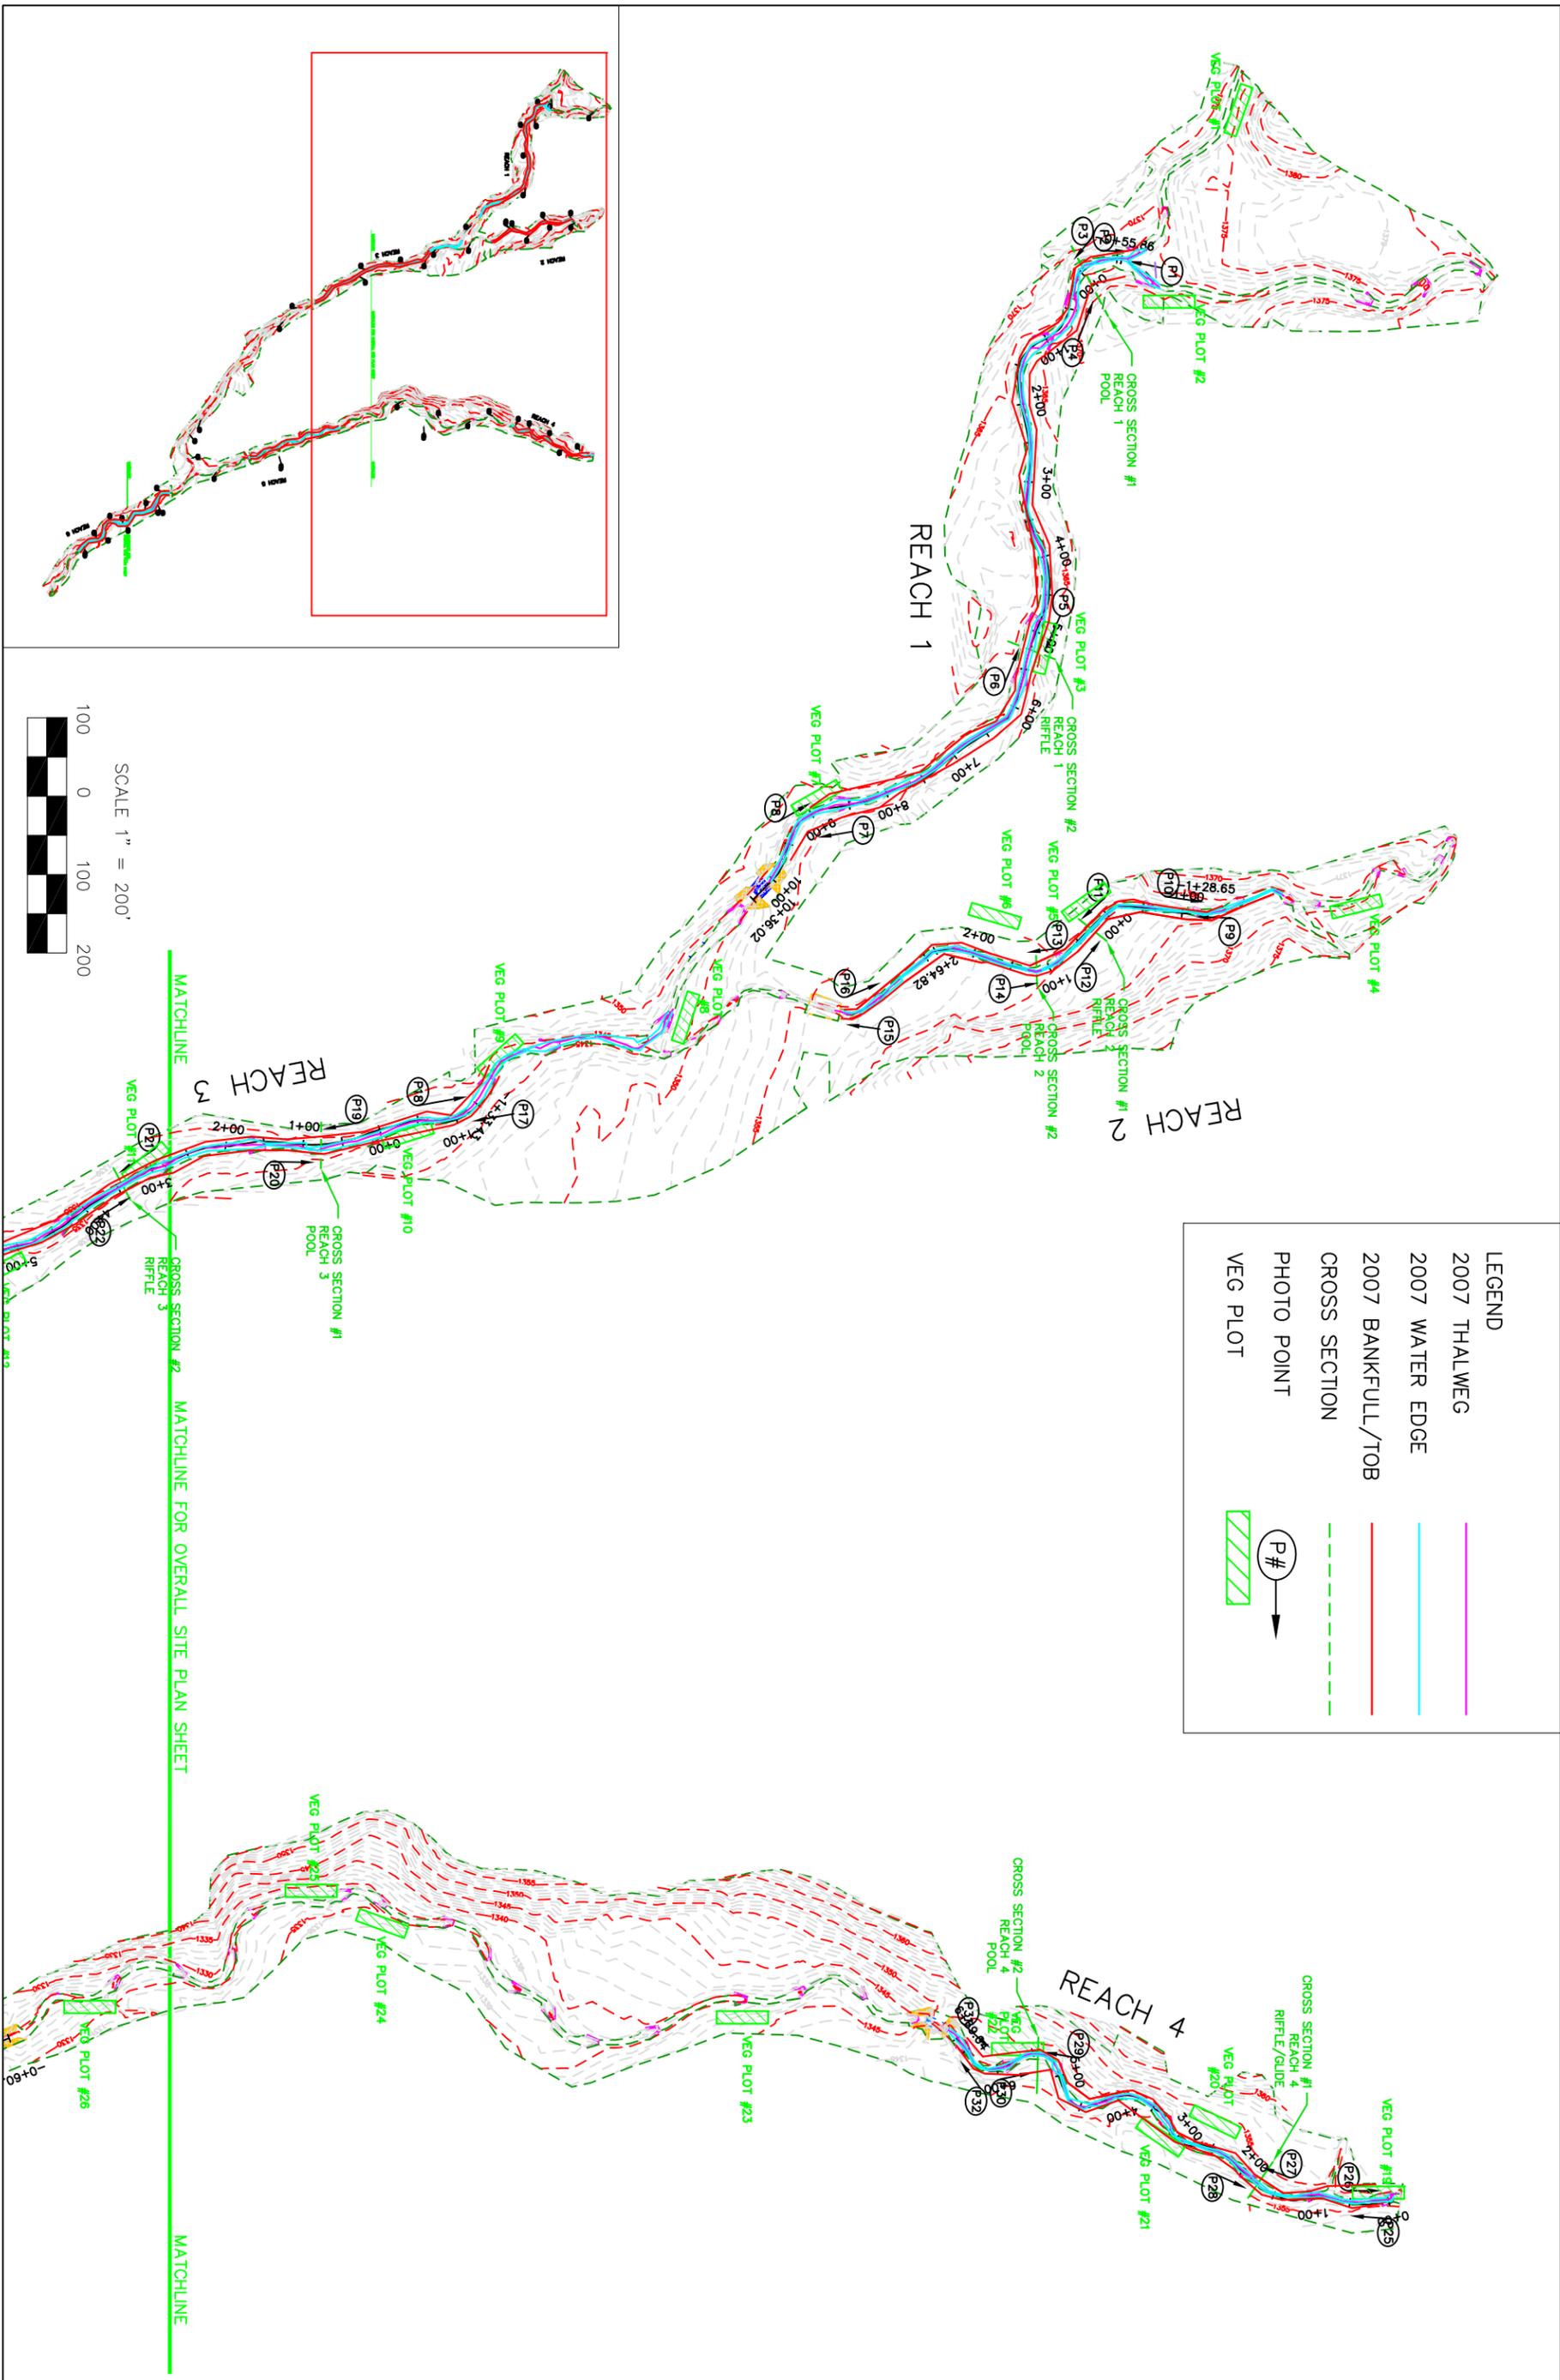

Figure 1. Project Location

Directions from Hwy. 421 in Wilkesboro:

From Wilkesboro on Hwy. 421, turn right onto NC-16. Follow NC-16 for 3.5 miles to the Miller's Creek intersection. Turn left onto Old Hwy. 421 (SR-1304) and follow for 2.6 miles. Turn right onto Purlear Road (SR-1346) and follow for 0.8 miles. You will come to a stop sign at a church, turn left to stay on Purlear Road (also called New Hope Road). Follow Purlear Road for 0.6 miles until the intersection with Vannoy Maxwell Road. Project begins at this intersection and continues through the intersection with CC Hayes Road (SR-1349).

Contact the EEP Project Manager for access and landowner notification instructions. Access is not permitted to this site without prior approval.

III. Project Condition and Monitoring Results

A. Vegetation Assessment

Twenty-eight (28) vegetation monitoring plots were surveyed in the riparian buffer of the Purlear Phase I project. All the plots had been previously established and sampled in 2005 and 2006. Plot numbering is consistent with numbering from previous monitoring reports.

Vegetation is generally successful at Purlear Phase I. In 2007, the lower reaches showed low flow and dry conditions on the terrace, with reduced herbaceous growth compared to previous years. However, planted stem survival between 2006 and 2007 was 95% in plots, and surviving planted stem density can be extrapolated from the 25 plots and estimated at 1068 planted stems per acre. Most trees were unaffected by cattle at the time of monitoring, but trees are at risk from repeated cattle incursions into the buffer. Trampling, manure, and grazing effects from individual cattle were sporadically in evidence throughout the upper half of the project. A few meters of electric fencing were trailing on the ground just downstream of the bridge halfway through the project, and a cow was observed inside the buffer during monitoring.

Vegetation data is presented in Appendix A of this report.

B. Stream Assessment

The stream channel is in a stable condition, with only localized problem areas identified in this survey.

Hydrologic Assessment

Continuous stage recorders were installed at various locations along the channel in the winter of 2005 for a graduate student research project. Table V lists the number of events equal to or greater than bankfull. The graduate research project ended in fall 2006 and no bankfull events were recorded in 2007.

Purlear Creek Phase I / Project # 294			
Date of Data Collection	Date of Occurrence	Method	Photo # (if available)
7/1/2006	06/26/2006	On-site transducer/data logger	
9/1/2006	08/30/2006	On-site transducer/data logger	
11/1/2006	10/21/2006	On-site transducer/data logger	

Note: No peak flow data was collected prior to the 2006 monitoring period.

Bank Stability Assessment - Monitoring Year 05

Table VI. BEHI and Sediment Export Estimates shall be included in the monitoring year 5 report.

Project Problem Area

The problem area Table B1, plan sheet and photographs can be found in Appendix B. The table lists current problem areas for 2007.

Several problem areas identified in previous monitoring years have been stabilized with a dense stand of vegetation. These previous areas of concern include cross vane structures with large bed elevation drops (> 0.5 feet) and localized areas of bank erosion. These areas have been removed from Table B1 since they are no longer considered problem areas.

Stream Visual Assessment

Table VII lists the results of a visual assessment conducted over each study reach. The data used to calculate the percentages listed in this table are found in Tables B2 in Appendix B.

Reach 1 – Upper Main Reach

The channel profile is similar to the as-built survey condition, with bedform features maintaining their locations and depths. This reach includes 8 cross vane grade controls with downstream elevation drops of greater than 0.5 ft. Three of these were located within the monitored reach, and four were located upstream. All were of concern in the 2005 monitoring report. Three vanes remain a concern in the current monitoring period due to the large elevation difference through the vane. Dense vegetation has established around all of the vanes minimizing the risk of failure.

Channel cross sections showed no significant changes in riffle cross sectional area but a large decrease in pool area was observed in the 2006 and 2007 survey compared to the as built condition. The source of the aggradation in the pool is likely off-site bank erosion directly upstream of the project. The pool section is located at the upper end of the project. This aggradation is not typical of the other pools in this reach. The reduction in area occurred in the point bar area although the max depth did decrease 0.4 to 0.7 feet from as built conditions. Overall pool quality has decreased but the section is not eroding and the meander is not migrating. Riffle dimensions remain consistent with as-built conditions.

A visual assessment of this reach showed a total decrease in number of riffles compared to the as built condition, but those that remain are mostly stable. Meanders are maintaining location and stability throughout the reach.

Reach 2 - Upper Middle Tributary

The channel profile is similar to the as-built survey condition, with the majority of bedform features maintaining their locations and depths. This reach includes seven cross vane grade controls with downstream elevation drops of greater than 0.5 ft. Of the seven, only one remains a concern for future stability. The remaining six have become embedded with dense vegetation around the vane arms. This vegetation has greatly reduced the risk of the vanes failing in the future. The average water surface slope is consistent with as-built conditions.

Channel cross sections have decreased in area significantly over the past year. Similar to Reach 1, sediment coming from off-site is the likely source. Throughout this reach, aggradation is evident along all channel banks. Dense vegetation is doing an excellent job of inducing aggradation along the channel banks. Channel thalweg is being maintained in the proper location and banks show no signs of degrading.

A visual assessment of this reach showed a decrease in riffle condition due to sediment overloading this reach. Meanders are maintaining location and stability throughout the reach.

Reach 3 – Middle Main Reach

The channel profile is similar to the as-built survey condition, with bedform features maintaining their locations and depths. This reach includes six cross vane grade controls with downstream elevation drops of greater than 0.5 ft. Three of these were removed from concern since dense vegetation is establishing along the vane arm, reducing the risk of piping or undermining. The three remaining structures continue to be at risk, but have not changed condition over the past year.

Channel cross sections are stable and remain similar to as-built conditions. Channel banks on both cross sections remain well vegetated and stable.

No aggradation or degradation has occurred in the channel, indicating the channel appears to be transporting the sediment load delivered to it by its watershed.

Channel pattern is similar to as-built conditions. Since the channel in this area is mostly straight, no pattern measurements were conducted. Dense vegetation is establishing along the channel banks. This vegetation is providing an excellent root mass to stabilize the banks.

Reach 4 – Lower Middle Tributary (Upper Section)

The channel profile is similar to the as-built survey condition, with bedform features maintaining their locations and depths. This reach includes four cross vane grade controls with downstream elevation drops of greater than 0.5 ft. However, all of the vanes appear stable due to the dense vegetation surrounding the vane arms. The vegetation has reduced the risk of piping or undercutting.

Channel cross sections are stable and remain similar to as-built conditions. A small decrease in area has occurred in both sections and is likely the result of a large sediment load entering the project from channel instability above this project. Channel banks are well vegetated and appear stable.

The typical bed material particle size continues to decrease as further evidence of the large sediment load entering the project from up stream. Dense vegetation has engulfed the channel which is adding to the sediment trapping along this reach. No erosion areas were observed along this reach.

A visual assessment of this reach showed bedform degraded slightly as a result of sediment deposition.

Area 5 - Lower Middle Tributary (Lower Section)

The channel profile is similar to the as-built survey condition, with bedform features maintaining their locations and depths. This reach includes five cross vane grade controls with downstream elevation drops of greater than 0.5 ft. All of these vanes appear stable due to the dense vegetation surrounding the vane arms. The vegetation has reduced the risk of piping or undercutting.

Channel cross sections are very stable and remain similar to as-built conditions. A small decrease in area has occurred in the riffle section. Vegetation has become well established within the active channel and is adding to the sediment deposition along the channel banks. Channel banks are well vegetated and appear stable. There are no areas of visible meander migrations throughout this reach. No erosion areas were observed along this reach.

A visual assessment of this reach showed bedform degraded slightly as a result of sediment deposition.

Reach 6 – Lower Main Reach

The channel profile is similar to the as-built survey condition, with bedform features maintaining their locations and depths. This reach includes five cross vane grade controls with downstream elevation drops of greater than 0.5 ft. Four of the vanes are within the study reach and one is located upstream. All of these vanes appear to have stabilized with dense vegetation and are no longer a concern.

The riffle cross section has increased slightly over the past two years. The riffle continues to increase in maximum depth and appears to be transitioning into a pool feature. The right bank is building as dense vegetation traps sediment. Both banks remain well vegetated and stable.

The left bank of the pool cross-section has not continued to migrate as it had between 2004 and 2005. Dense herbaceous cover and willow stakes are quickly establishing and the bank appears to have stabilized.

Channel pattern is similar to as-built conditions. Dense vegetation is establishing along the channel banks in most areas. This vegetation is providing an excellent root mass to stabilize the banks. The only observed area of meander migration is the area along the pool cross-section although this appears to have stabilized.

Two drain tiles that were installed in fall 2005 are still draining water through the buffer and adjacent field.

Quantitative Measures Summary Tables

The tables below present all of the quantitative summary data from the survey cross-sectional surveys, longitudinal surveys, and pebble counts. The associated raw data and plots are located in Appendix B of this report.

VI. Methodology Section

Monitoring methods used are based on US Army Corps of Engineering and NC Division of Water Quality Guides as referenced below.

The taxonomic standard for vegetation used in this report was based on “Flora of the Carolinas, Virginia, Georgia, and Surrounding Areas”, by Alan S. Weakley. The vegetation monitoring protocol used for collecting vegetation data was the CVS-EEP Protocol for Recording Vegetation Version 4.0 (Lee et al. 2006).

Notes:

- No separate plan view was established for vegetation conditions. See monitoring plan view for this information.

Table 1. Vegetation Metadata

Report Prepared By	Nathan Buchanan
Date Prepared	10/19/2007 14:23
database name	CVS_EEP_EntryTool_v220.mdb
database location	\\atlantic\group\Nathan B\Purlear\EEP CVS DATA Entry
computer name	WOLFPREP1
DESCRIPTION OF WORKSHEETS IN THIS DOCUMENT-----	
Metadata	This worksheet, which is a summary of the project and the project data.
Proj, planted	Each project is listed with its PLANTED stems, for each year. This excludes live stakes and lists stems per acre.
Proj, total stems	Each project is listed with its TOTAL stems, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems. Listed in stems per acre.
Plots	List of plots surveyed.
Vigor	Frequency distribution of vigor classes.
Vigor by Spp	Frequency distribution of vigor classes listed by species.
Damage	List of most frequent damage classes with number of occurrences and percent of total stems impacted by each.
Damage by Spp	Damage values tallied by type for each species.
Damage by Plot	Damage values tallied by type for each plot.
ALL Stems by Plot and spp	Count of total living stems of each species (planted and natural volunteers combined) for each plot; dead and missing stems are excluded.
PROJECT SUMMARY-----	
Project Code	Purlear 1
project Name	Purlear Phase 1
Description	
River Basin	
length(ft)	
stream-to-edge width (ft)	
area (sq m)	
Required Plots (calculated)	
Sampled Plots	25

Table B2. Visual Morphological Stability Assessment						
Purlear Creek Phase I / Project # 294 - Upper Main						
Reach 1 - 1050						
Feature Category	Metric (per As-built and reference baselines)	(# Stable) Number Performing as Intended	Total number per As-built	Total Number / feet in unstable state ¹	% Perform in Stable Condition ²	Feature Perform. Mean or Total ³
A. Riffles	1. Present? ⁴	11	13	NA	85	
	2. Armor stable (e.g. no displacement)?	11	13	NA	85	
	3. Facet grade appears stable?	11	13	NA	85	
	4. Minimal evidence of embedding/fining?	11	13	NA	85	
	5. Length appropriate?	11	13	NA	85	85%
B. Pools	1. Present? (e.g. not subject to severe aggrad. or migrat.?) ⁴	13	13	NA	100	
	2. Sufficiently deep (Max Pool D:Mean Bkf >1.6?)	13	13	NA	100	
	3. Length appropriate?	10	13	NA	77	92%
C. Thalweg	1. Upstream of meander bend (run/inflection) centering? ⁵	8	8	NA	100	
	2. Downstream of meander (glide/inflection) centering? ⁵	8	8	NA	100	100%
D. Meanders	1. Outer bend in state of limited/controlled erosion?	8	8	NA	100	
	2. Of those eroding, # w/concomitant point bar formation?	0	0	NA	100	
	3. Apparent Rc within spec?	3	3	NA	100	
	4. Sufficient floodplain access and relief? ⁶	8	8	NA	100	100%
E. Bed General	1. General channel bed aggradation areas (bar formation)	NA	NA	0/0	100	
	2. Channel bed degradation – areas of increasing down-cutting or head cutting?	NA	NA	0/0	100	100%
F. Bank	1. Actively eroding, wasting, or slumping bank	NA	NA	0/0	100%	100%
G. Vanes	1. Free of back or arm scour?	4	5	NA	80	
	2. Height appropriate?	1	5	NA	20	
	3. Angle and geometry appear appropriate?	5	5	NA	40	
	4. Free of piping or other structural failures?	4	5	NA	80	55%
F. Wads/Boulders	1. Free of scour?	NA	NA	NA	NA	
	2. Footing stable?	NA	NA	NA	NA	NA

Footnotes:

The above table should be completed using the visual assessment data form for each project reach/segment

It is recognized that the various metrics within a feature category may not have equal influence on the overall stability of that feature and that this does not incorporate weighting or scoring; however, at this time, EEP requires documentation of the relevant observations for these feature categories.

1 Metrics that are spatial estimates should be entered as: The number of locales over the reach for which the failing condition is observed / followed by the total linear distance (feet) or area for which the failing or unstable condition is observed.

2 In the case of categorical metrics for which a feature count is involved, this is simply calculated as the number of functional features that are in a state of stability as a percentage of the total. In the case of those metrics based on footage or aerial extent it is that amount in a state of failure or instability expressed as a proportion of the total amount of that feature. The resulting proportion is then subtracted from 1 and then multiplied by 100 to give a percentage that represents the proportion of that feature category in a state of apparent stability.

3 The mean of the metrics for a given feature category.

4 Was the feature actually present as compared to the As-built or has the feature been completely obscured (aggraded) or removed (degraded).

5 Is the Thalweg centering up on the channel in between meander bends?

6 Is the meander bend in a state of constriction?
