June 2006

Executive Summary

Phase II of the Purlear Creek Stream and Wetland Restoration project falls within USGS hydrologic unit **0304010110090** in the Yadkin River Basin. The project streams and wetland lie within an agricultural setting comprised predominantly of cattle operations. Prior to restoration work, the project streams had been destabilized through historic straightening, cattle traffic, and a conversion of the watershed to more impervious surfaces. The wetland hydrology had been impacted due to modification of the streams. Cattle grazing and historic planting has mostly limited the wetland and riparian communities to a few species of herbaceous plants and invasive trees.

Riparian and wetland planting was completed on January 24, 2006. Eight vegetation quads were set up for permanent monitoring in March 2006 and these quads were assessed for stem counts at that time. Two species were unidentifiable due to a lack of distinct characteristics visible during the dormant season. For quads 1-7, the stem counts greatly exceeded year 3 success criteria. Quad 8 barely exceeded year 3 success criteria and should be monitored closely for continued adherence to success criteria.

A stream assessment including a visual assessment and geomorphic survey indicated that the project reaches were performing within established success criteria ranges. The initial visual assessment showed two concerns for stability that may become issues in the future. In the section of Reach 1 between stations 67+66 and 68+41, two transverse bars were directing flow into the outer banks of downstream pools. These bars have not caused significant erosion. Two A-Vane structures in Reach 4 at stations 305+91 and 312+32 had piping in the lower cross. The structures continue to maintain function. The geomorphic measurements for both reaches are within the range of the design parameters.

Site wetland hydrology could not be assessed due to malfunctioning wells. These wells will require maintenance to continue wetland hydrology monitoring. The restoration and enhancement wetland areas appear to have become wetter since completion of the restoration work. Vegetation Quads #1 and #6 fall within the wetland and were used to assess wetland vegetation.

1.0 Project Background

1.1 Location and Setting

Phase II of the Purlear Creek Stream and Wetland Restoration project falls within the Hayes Property in Wilkes County, North Carolina approximately 8 miles northwest of the Town of Wilkesboro. The most direct route to the site from North Wilkesboro is described as follows:

Take US 421 to the intersection with NC 16 and turn right. Travel north – northwest on NC16 to the intersection with Boone Trail (Old US-421) in the town of Miller's Crossroads. Turn left and travel west to a 3-way intersection with Purlear Road. Turn right and travel north until the intersection with Shingle Gap Road and Old NC-60. Turn left onto New Hope Road and travel west until crossing a one lane bridge. The project ends at the one land bridge.

Figure 1 shows the project vicinity and mitigation features.

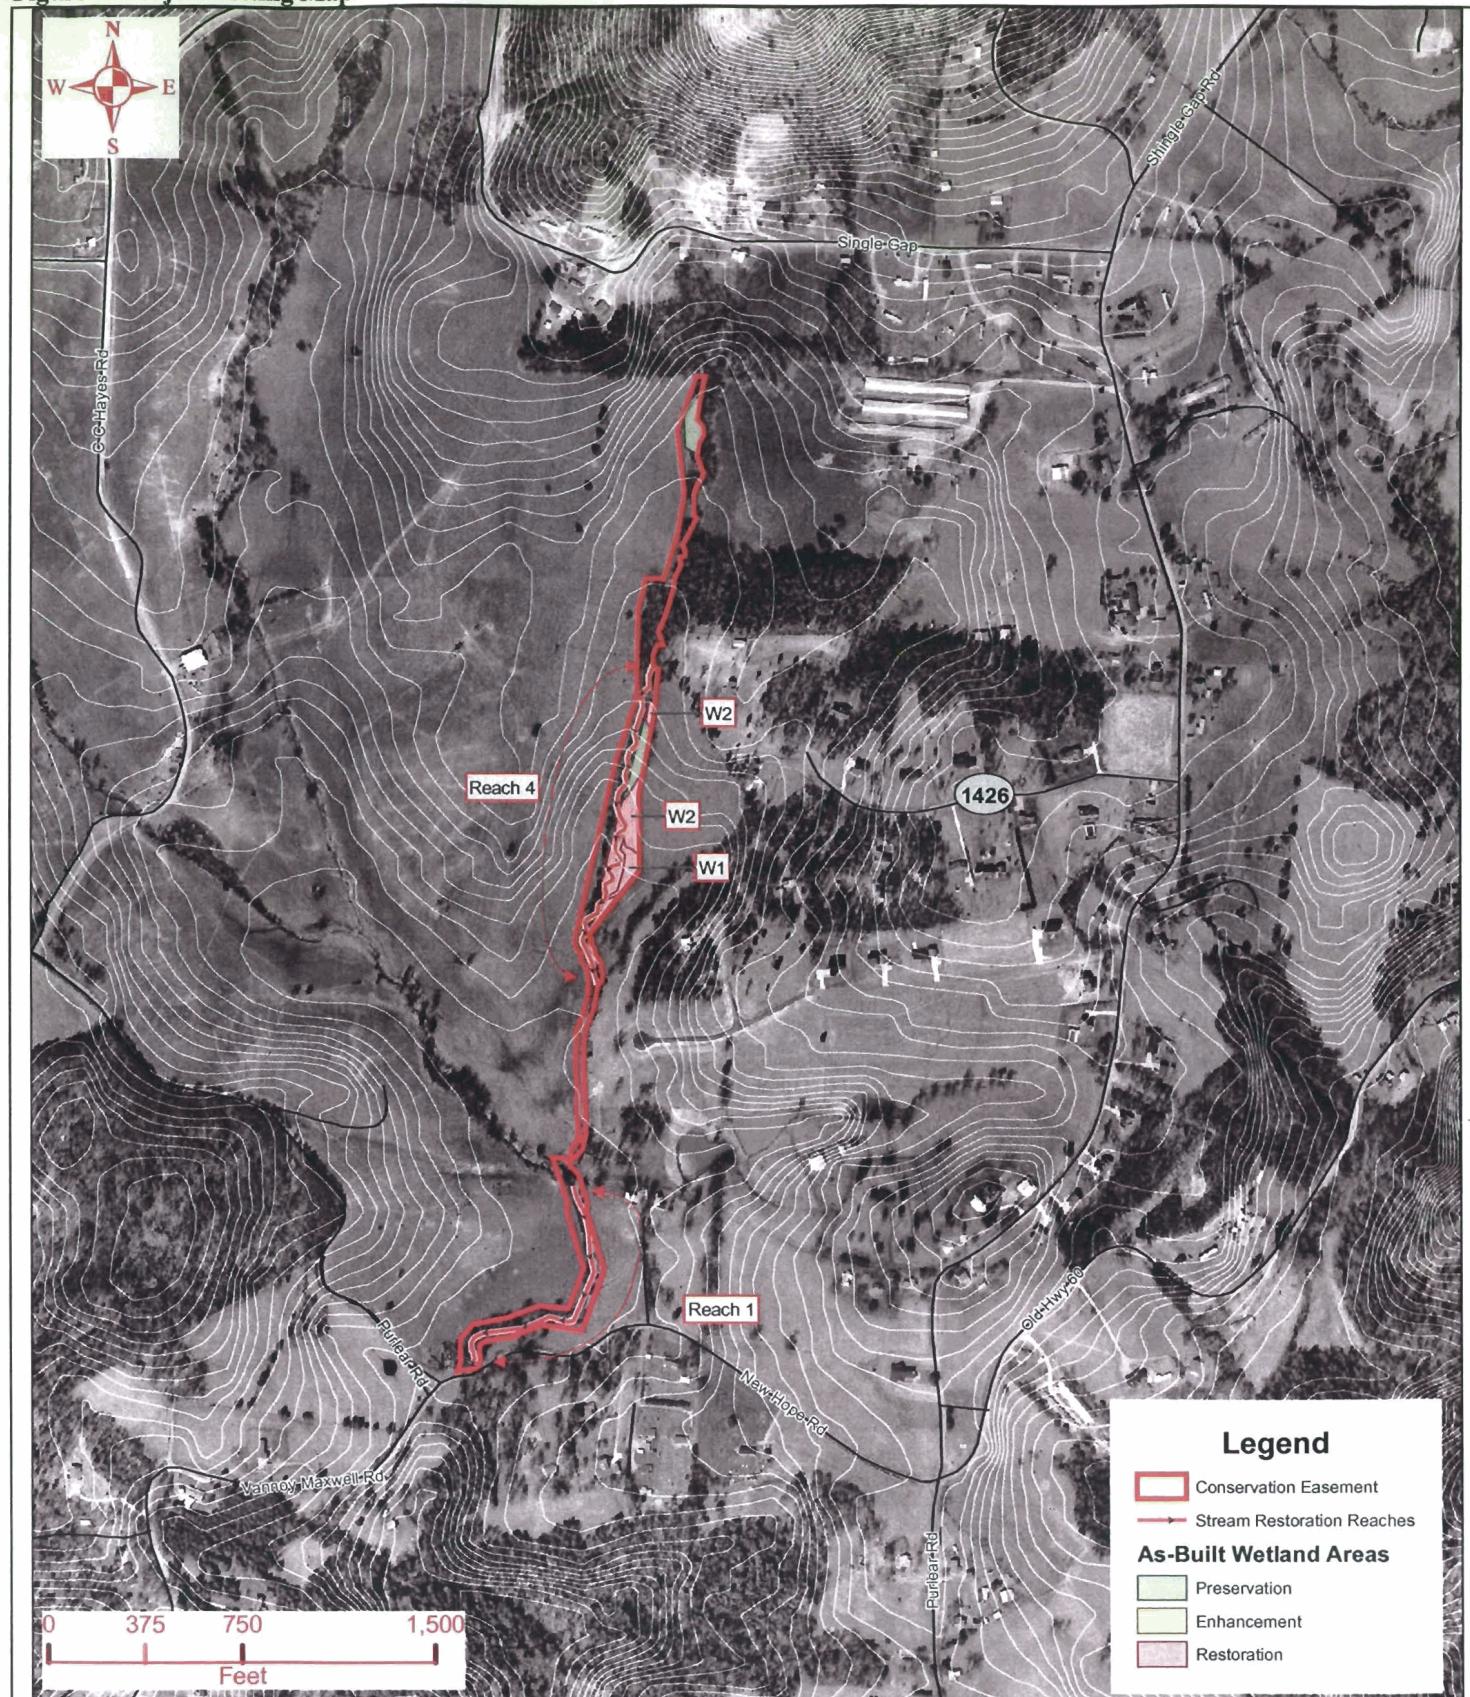

1.2 Project Structure, Mitigation Type, Approach and Objectives

Phase II of the Purlear Creek stream and wetland restoration project strives to restore two (2) stream reaches and restore and enhance adjacent riparian wetlands. Both streams lie within an area that was actively used for cattle grazing. The alignments of the channels also indicate that the channels have been straightened and channelized. The designer used a Priority I approach to restore the upper reach (Reach 4). A new channel was dug into the abandoned floodplain. For the lower reach (Reach 1), the designer used a Priority II approach to restore the reach. The existing channel banks were laid back to create an expanded floodplain and new channel alignment was placed within the expanded floodplain. For both reaches, in-stream structures such as A-Vane, Cross-Vanes, and J-Hooks were installed to provide additional stability to the channel. Root wads were installed to provide additional habitat.

Much of the riparian wetlands had been cleared and cattle grazing severely limited regrowth of woody vegetation. Groundwater and surface water hydrological components were impaired due to channelization of the adjacent stream. Priority I restoration of the adjacent stream should restore the wetland hydrology by increasing the frequency and duration of overbank flows into the wetland and raising the groundwater elevations that are influenced by the base flow elevation of the stream.

Most of the riparian corridor (including the riparian wetland) had been cleared and maintained as pasture. The ecological function of the corridor relative to the streams and wetland had been impaired. The restoration effort planted the area with a mix of woody vegetation to help reestablish a viable riparian forest community. The planting plan assumes that there is adequate seed source for herbaceous species to reestablish in the area. The planted area will be maintained to promote the growth of planted and preferred volunteer species and to limit populations of nuisance and invasive species.

*Vegetation survey occurred in winter after planting. Two species were unidentifiable.

2.2 Stream Assessment

The Year 0 visual stream assessment found minor problems with the stream. Two structures in Reach 4 had minor piping in the lower cross of the A-Vane. The piping did not seem to impair overall function of the structures and may be self repaired with sediment for upstream. In Reach 1, two transverse bars have formed between stations 67+66 and 68+41. These features have the potential to cause downstream bank erosion.

Exhibit Table VIII: Stream Problem Areas

Feature Issue	Reach	Station numbers	Description	Suspected Cause	Photo number
Aggradation/Bar Formation	--	--	--	--	--
	--	--	--	--	--
Bank scour	1	305+91	Potential for scour from transverse bar	--	SP01

2.3 Wetland Assessment

A quantitative assessment of Year 0 wetland hydrology was not possible due to malfunctioning of the sampling wells. The wells will need to be repaired to continue monitoring of wetland hydrology. Vegetation Quads #1 and #6 were used to assess wetland vegetation status. As shown in section 3.1, these quads shows that vegetation growth in the wetland currently exceeds success criteria.

Exhibit Table XI: Wetland Criteria Attainment

Tract	Well ID	Well Hydrology Threshold Met?	Tract Mean	Vegetation Plot ID	Vegetation Survival Threshold Met?	Tract Mean
W1 & W2	RDS-W1	--	--	V1	Y	100%
	RDS-W2	--		V6	Y	

* Wells are malfunctioning and require maintenance to continue wetland hydrology monitoring

3.0 Methodology

Monitoring methods for the Year 0 assessment did not deviate from the procedure described in the mitigation report.

	3 Facet grade appears stable?			35	35	100%	
	4 Minimal evidence of embedding/fining?			35	35	100%	
	5 Length appropriate?			35	35	100%	
B. Pools	1 Present? (e.g. not subject to severe aggrad. or migrat.?)			34	34	100%	
	2 Sufficiently deep (Max Pool D:Mean Blf >1.6?)			34	34	100%	
	3 Length appropriate?			34	34	100%	
C. Thalweg	1 Upstream of meander bend (run/inflection) centering?			27	27	100%	
	2 Downstream of meander (glide/inflection) centering?			27	27	100%	
D. Meanders	1 Outer bend in state of limited/controlled erosion?			27	27	100%	
	2 Of those eroding, # w/concomitant point bar formation?			--	--		
	3 Apparent Rc within spec?			27	27	100%	
	4 Sufficient floodplain access and relief?			27	27	100%	
E. Bed General	1 General channel bed aggradation areas (bar formation)			1436	1436	100%	
	2 Channel bed degradation – areas of increasing down-cutting or head cutting?			1436	1436	100%	
F. Vanes	1 Free of back or arm scour?			29	29	100%	
	2 Height appropriate?			29	29	100%	
	3 Angle and geometry appear appropriate?			29	29	100%	
	4 Free of piping or other structural failures?			27	29	93%	
G. Wads/ Boulders	1 Free of scour?			--	--		
	2 Footing stable?			--	--		--
