NCDMS Comment Responses:

- While not required, we highly recommend following the new DMS monitoring template updated in October of 2020 in future monitoring reports. *This will be done during the compilation of future monitoring reports for the project.*
- 2. Appendix B Please include a feature depicting the 40 ft. of bank erosion in the CCPV (Figure 2), and include this feature in the digital submittal.

The bank erosion in Table 5 was misidentified by field personnel and mistakenly included in the draft Y1 Report. It has been removed from the document. All site reaches are stable and there are no areas of concern.

- 3. Appendix D
  - a. Remove Tables 12A through 12D from the report and from the Table of Contents. *Tables 12A-12D have been removed.*
  - Tables 13A to 13D BHR is not necessary to calculate on pool features and recommend removing. Also, DMS recommends in future reports to use the updated (Oct. 2020) geomorphology tables which require fewer parameters and are tailored to the best fit BHR calculation method.

BHR calculations were removed from all pool cross-sections. Using the geomorphology tables from the Oct. 2020 guidance will be considered for the Year 2 (2021) Annual Monitoring Report.

- c. Cross Sections We recommend entering N/A for BHR in the Summary Data tables for pool features. Also, we recommend removing the MY-00 TOB line (green, dashed line) from the cross sections. Only need to show (calculated) bankfull and LTOB. BHR calculations were removed from pool cross-section reports, and the MY-00 TOB lines were removed from all cross-section plots.
- 4. Please review the cross section calculations and ensure that the BHR, low bank height, and max bankfull height are calculated and reported correctly. For example, UT2-XS 1 has a low bank height of 0.96, but is reported as 1.0, and the BHR is calculated using 1.0. Using the correct value produces a BHR closer to 1.0 than 1.1.

BHRs were recalculated for all riffle cross-sections using unrounded max bankfull depths and low bank heights.

5. Please remove Appendix F – Notice of Credit Release from the report and Table of Contents. Appendix F was removed from the report and table of contents.

#### Slingshot Year 1, 2020 Monitoring Summary

#### **General Notes**

- No encroachment was identified in Year 1
- No evidence of nuisance animal activity (i.e., beaver, heavy deer browsing, etc.) was observed.

#### Streams

• Stream monitoring show that all stream channels and structures are stable.

#### Wetlands

• Ten of Eleven groundwater gauges met success for the Year 1 (2020) monitoring period. Wetland hydrology data is in Appendix E.

~	Success Criteria Achieved/Max Consecutive Days During Growing Season (Percentage)								
Gauge	Year 1 (2020)	Year 2 (2021)	Year 3 (2022)	Year 4 (2023)	Year 5 (2024)	Year 6 (2025)	Year 7 (2026)		
1	Yes 26 days (11.4%)								
2	Yes 61 days (26.8%)								
3	Yes 187 days (82.0%)								
4	Yes 187 days (82.0%)								
5	Yes 100 days (43.9%)								
6	Yes 127 days (55.7%)								
7	Yes 83 days (36.4%)								
8	Yes 29 days (12.7%)								
9	Yes 73 days (32.0%)								
10	No 4 days (1.8%)								
11*	Yes 46 days (20.2%)								

\*Gauge 11 was installed in an area not previously identified for wetland reestablishment but appeared to be exhibiting wetland characteristics post-construction.

### **Vegetation Summary**

Year 1 (2020) vegetation measurements occurred on November 18, 2020 and included 2 additional random sample plots (25-meter by 4-meter). Measurements of all 12 plots resulted in an average of 711 planted stems/acre excluding livestakes. Additionally, all individual plots met success criteria (Tables 8-10, Appendix C).

# **1.0 PROJECT SUMMARY**

Restoration Systems, LLC has established the North Carolina Division of Mitigation Services (NCDMS) Slingshot Mitigation Site (Site).

# **1.1 Project Goals & Objectives**

Project goals were based on the *Cape Fear River Basin Restoration Priorities* (RBRP) report (NCEEP 2009) and on-site preconstruction data collection of channel morphology and function observed during field investigations. The Site is located within Targeted Local Watershed (TLW) 03030002010010. The RBRP report documents benthic ratings vary between "Fair" and "Good-Fair" possibly due to cattle, dairy, and poultry operations.

The project is located within the Troublesome Creek and Little Troublesome Creek Local Watershed Planning area (NCEEP 2004); project activities addressed priorities associated with the LWP as follows with Site specific information following the LWP goals in parenthesis.

- 1. Protect and improve water quality by restoring wetland, stream, and riparian area functions and values, which may have been, or may be, lost through historic, current, and future impacts (4115 linear feet of stream restored/enhanced/preserved, 1.71 acres of wetland restored/enhanced, and 11.6. acres of riparian buffer restored/enhanced).
- 2. Achieve a net increase in riparian zone buffers and wetlands acreage, functions, and values (11.6 acres of riparian buffer were restored/enhanced, and wetland acreage was increased by 1.02 acres).
- 3. Promote a comprehensive approach for the protection of natural resources (protected the Site, streams, wetlands, and riparian buffer through a permanent conservation easement).

In addition to the defined Troublesome Creek LWP goals, additional goals for the area generally revolve around reduction of stressors to water quality. Stressors and how each were addressed by project activities is as follows.

- 1. Nutrient Inputs (livestock were removed from streams resulting in a direct reduction of 474.7 pounds of nitrogen, 39.3 pounds of phosphorus per year, and 4.7 x 10<sup>11</sup> colonies of fecal coliform; eliminated fertilizer applications; and installed marsh treatment areas).
- 2. Streambank Erosion (reduction of 220 tons of sediment per year).
- 3. Stormwater (reduced bank height ratios and installed marsh treatment area to reduce stormwater pulses).
- 4. Disturbed Riparian Buffer (restored/enhanced 11.6 acres of riparian buffer along 4115 linear feet of stream).
- 5. Floodplain Alteration (eliminated straightened, entrenched streams and removed spoil material deposited in the floodplain).

Site specific mitigation goals and objectives were developed through the use of North Carolina Stream Assessment Method (NC SAM) and North Carolina Wetland Assessment Method (NC WAM) analyses of preconstruction and reference stream systems at the Site (NC SFAT 2015 and NC WFAT 2010) (see table below).

#### Stream/Wetland Targeted Functions, Goals, and Objectives

Targeted Functions	Goals	Objectives	Compatibility of Success Criteria
(1) HYDROLOGY			
<ul> <li>(2) Flood Flow (Floodplain Access)</li> <li>(3) Streamside Area Attenuation</li> <li>(4) Floodplain Access</li> <li>(4) Wooded Riparian Buffer</li> <li>(3) Stream Stability</li> </ul>	<ul> <li>Attenuate flood flow across the Site.</li> <li>Minimize downstream flooding to the maximum extent possible.</li> <li>Connect streams to functioning wetland systems.</li> </ul>	<ul> <li>Construct new channel at historic floodplain elevation to restore overbank flows and restore jurisdictional wetlands</li> <li>Plant woody riparian buffer</li> <li>Remove livestock</li> <li>Deep rip floodplain soils to reduce compaction and increase soil surface roughness</li> <li>Protect riparian buffers with a perpetual conservation easement</li> </ul>	<ul> <li>Over the monitoring period BHR not</li> <li>Document four overbank events in set</li> <li>Livestock excluded from the easement</li> <li>Attain Wetland Hydrology Success C</li> <li>Attain Vegetation Success Criteria</li> <li>Conservation Easement recorded</li> <li>Cross-section measurements indicate</li> </ul>
<ul> <li>(3) Stream Stability</li> <li>(4) Sediment Transport</li> <li>(4) Stream Geomorphology</li> </ul>	• Increase stream stability within the Site so that channels are neither aggrading nor degrading.	<ul> <li>Construct channels with proper pattern, dimension, and longitudinal profile</li> <li>Remove livestock</li> <li>Construct stable channels with cobble/gravel substrate</li> <li>Plant woody riparian buffer</li> </ul>	<ul> <li>substrate</li> <li>Visual documentation of stable chanr</li> <li>Over the monitoring period BHR not</li> <li>&lt;10% change in BHR over the moni</li> <li>Livestock excluded from the easement</li> <li>Attain Vegetation Success Criteria</li> </ul>
(1) WATER QUALITY			
<ul> <li>(2) Streamside Area Vegetation</li> <li>(3) Upland Pollutant Filtration</li> <li>(2) Indicators of Stressors</li> <li>Wetland Particulate Change</li> </ul>	• Remove direct nutrient and pollutant inputs from the Site and reduce contributions to downstream waters.	<ul> <li>Remove livestock and reduce agricultural land/inputs</li> <li>Install marsh treatment areas, where necessary</li> <li>Plant woody riparian buffer</li> <li>Restore/enhance jurisdictional wetlands adjacent to Site streams</li> </ul>	<ul> <li>Livestock excluded from the easement</li> <li>Attain Wetland Hydrology Success C</li> <li>Attain Vegetation Success Criteria</li> </ul>

## 1.2 Project Background

The Slingshot Mitigation Site (hereafter referred to as the "Site") encompasses 11.6 acres of disturbed forest and livestock pasture along warm water, unnamed tributaries to Lake Hunt. The Site is located approximately 2 miles west of Reidsville, just east of Lake Hunt, and north NC Highway 158 in Rockingham County (Figure 1, Appendix A).

Prior to construction, Site land use consisted of livestock pasture, hay fields, and disturbed forest. Livestock had unrestricted access to Site streams. A narrow riparian fringe had developed on the stream margins that was composed of opportunistic species, invasive species, and a few mature tree species. Approximately 55 percent of the stream channel was degraded contributing to sediment export from the Site resulting from mechanical processes from livestock hoof shear. In addition, streamside wetlands were cleared and drained by channel downcutting and land uses. Preconstruction Site conditions resulted in degraded water quality, a loss of aquatic habitat, reduced nutrient and sediment retention, and unstable channel characteristics (loss of horizontal flow vectors that maintain pools and an increase in erosive forces to channel bed and banks). Site restoration activities restored riffle-pool morphology, aided in energy dissipation, increased aquatic habitat, stabilized channel banks, and greatly reduced sediment loss from channel banks.

# 1.3 Project Components and Structure

Proposed Site restoration activities generated 3185 Stream Mitigation Units (SMUs) and 1.321 Riparian Wetland Mitigation Units (WMUs) as the result of the following.

- 2501 linear feet of Priority I stream restoration
- 587 linear feet of stream enhancement (Level I)
- 635 linear feet of stream enhancement (Level II)
- 391 linear feet of stream preservation
- 1.018 acre of riparian wetland restoration
- 0.606 acre of riparian wetland enhancement

Additional activities that occurred at the Site included the following.

• Planting 12.05 acres of the Site with 10,950 stems (planted species are included in Table 5 [Appendix C]).

Deviations from the construction plans included removing the left vane arm from the structure at sta. 05+63 on Slingshot Creek and removing the three log cross-vanes between sta. 03+00 and 04+00 on UT1 due to bedrock presence. No other deviations of significance occurred between construction plans and the as-built condition. In addition, no issues have arisen since construction occurred.

Site design was completed in November 2019. Construction started on March 13, 2020 and ended within a final walkthrough on April 30, 2020. The Site was also planted on April 30, 2020. Completed project activities, reporting history, completion dates, project contacts, and background information are summarized in Tables 1-4 (Appendix A).

### 1.4 Success Criteria

Project success criteria have been established per the October 24, 2016 NC Interagency Review Team *Wilmington District Stream and Wetland Compensatory Mitigation Update*. Monitoring and success criteria relate to project goals and objectives. From a mitigation perspective, several of the goals and objectives are assumed to be functionally elevated by restoration activities without direct measurement. Other goals and objectives will be considered successful upon achieving success criteria. The following table summarizes Site success criteria.

#### Success Criteria

Streams

- All streams must maintain an Ordinary High-Water Mark (OHWM), per RGL 05-05.
- Bank height ratio (BHR) cannot exceed 1.2 at any measured cross-section over the monitoring period.
- BHR at any measured riffle cross-section should not change by more than 10% from baseline condition over monitoring period.
- A minimum of 30-days continuous surface flow for intermittent streams.
- The stream project shall remain stable and all other performance standards shall be met through four separate bankfull events, occurring in separate years, during the monitoring years 1-7.

#### Wetland Hydrology

• Saturation or inundation within the upper 12 inches of the soil surface for, at a minimum, 10 percent of the growing season, during average climatic conditions. Note: Growing season length will be confirmed with a continuous recording temperature gauge that will measure from February to April each monitoring year.

#### Vegetation

- Within planted portions of the Site, a minimum of 320 stems per acre must be present at year 3; a minimum of 260 stems per acre must be present at year 5; and a minimum of 210 stems per acre must be present at year 7.
- Trees must average 7 feet in height at year 5, and 10 feet in height at year 7 in each plot.
- Planted and volunteer stems are counted, provided they are included in the approved planting list for the site; natural recruits not on the planting list may be considered by the IRT on a case-by-case basis.

Note: BHR will be calculated using procedures outlined in the latest approved guidance from NCDMS.

#### 2.0 METHODS

Monitoring will be conducted by Axiom Environmental, Inc. Annual monitoring reports of the data collected will be submitted to the NCDMS by Restoration Systems no later than December 31 of each monitoring year data is collected. The monitoring schedule is summarized in the following table.

#### **Monitoring Schedule**

Resource	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6	Year 7
Streams							
Wetlands							
Vegetation							
Macroinvertebrates							
Visual Assessment*							
Report Submittal							

\*Visual Assessment will be complimented by permanent photographic points located at each permanent cross section and vegetation plot.

#### 2.1 Monitoring

The monitoring parameters are summarized in the following table.

#### **Monitoring Summary**

		Stream Parame	eters	
Parameter	Method	Schedule/Frequency	Number/Extent	Data Collected/Reported
Stream Profile	Full longitudinal survey	As-built (unless otherwise required)	All restored stream channels	Graphic and tabular data.
Stream Dimension	Cross-sections	Years 1, 2, 3, 5, and 7	Total of 14 cross-sections on restored channels	Graphic and tabular data.
Channel Stability	Visual Assessments	Yearly	All restored stream channels	Areas of concern will be depicted on a plan view figure with a written assessment and photograph of the area included in the report.
	Additional Cross-sections	Yearly	Only if instability is documented during monitoring	Graphic and tabular data.
Stream Hydrology	Continuous monitoring surface water gauges and/or trail camera	Continuous recording through monitoring period	Stream flow regime is not in question. However, surface water gauges and/or cameras will be used to document bankfull events.	NA
Bankfull Events	Continuous monitoring surface water gauges and/or trail camera	Continuous recording through monitoring period	Surface water gauge on Slingshot Creek and UT 1	Surface water data for each monitoring period
Dankiun Events	Visual/Physical Evidence	Continuous through monitoring period	All restored stream channels	Visual evidence, photo documentation, and/or rain data.
Benthic Macroinvertebrates Benthic Macroinvertebrates Benthic Macroinvertebrates, Version 5.0 (NCDWR 2016)		Pre-construction, Years 3, 5, and 7 during the "index period" referenced in <i>Small</i> <i>Streams Biocriteria</i> <i>Development</i> (NCDWQ 2009)	2 stations (one at the lower end of UT1 and one at the lower end of Slingshot Creek)	Results* will be presented on a site-by- site basis and will include a list of taxa collected, an enumeration of <i>Ephemeroptera, Plecoptera,</i> and <i>Tricopetera</i> taxa as well as Biotic Index values.
		Wetland Param	eters	
Parameter	Method	Schedule/Frequency	Number/Extent	Data Collected/Reported
Wetland Restoration	Groundwater gauges	Years 1, 2, 3, 4, 5, 6, and 7 throughout the year with the growing season defined as March 26-November 8	11 gauges spread throughout restored/enhanced wetlands	Soil temperature at the beginning of each monitoring period to verify the start of the growing season, groundwater and rain data for each monitoring period
		Vegetation Paran	neters	
Parameter	Method	Schedule/Frequency	Number/Extent	Data Collected/Reported
Vegetation establishment and	Permanent vegetation plots 0.0247 acre (100 square meters) in size; CVS-EEP Protocol for Recording Vegetation, Version 4.2 (Lee et al. 2008)	As-built, Years 1, 2, 3, 5, and 7	10 plots spread across the Site	Species, height, planted vs. volunteer, stems/acre
vigor	Annual random vegetation plots, 0.0247 acre (100 square meters) in size	As-built, Years 1, 2, 3, 5, and 7	2 plots randomly selected each year	Species and height

\*Benthic Macroinvertebrate sampling data will not be tied to success criteria; however, the data may be used as a tool to observe positive gains to in-stream habitat

### Stream Summary

All streams are functioning as designed, and no stream areas of concern were observed during year 1 (2020) monitoring. Stream morphology data is available in Appendix D.

## Wetland Summary

Summary of Monitoring Period/Hydrology Success Criteria by Year

Year	Soil Temperatures/Date Bud Burst Documented	Monitoring Period Used for Determining Success	10 Percent of Monitoring Period	
2020 (Year 1)	March 26, 2020*	March 26-November 8 (228 days)	23 days	

\*NRCS growing season used for MY1 (2020) since gauges and soil temperature logger were not installed until May 6, 2020.

All groundwater gauges met success criteria for the year 1 (2020) monitoring period except Gauge 10 (Appendix E).

# Vegetation Summary

During quantitative vegetation sampling, 10 sample plots (10-meter by 10-meter) were installed within the Site as per guidelines established in *CVS-EEP Protocol for Recording Vegetation*, *Version 4.2* (Lee et al. 2008). Year 1 (2020) vegetation measurements occurred on November 18, 2020 and included 2 additional random sample plots (25-meter by 4-meter). Measurements of all 12 plots resulted in an average of 711 planted stems/acre excluding livestakes. Additionally, all individual plots met success criteria (Tables 8-10, Appendix C).

# Vegetation Condition Assessment

Planted Acreage <sup>1</sup>	Slingshot 9.3		
Vegetation Category	Definitions	Mapping Threshold	CCI Depic
1. Bare Areas	None	0.1 acres	nor
2. Low Stem Density Areas	None	0.1 acres	nor
2B. Low Planted Stem Density Areas	None	0.1 acres	nor
3. Areas of Poor Growth Rates or Vigor	None	0.25 acres	nor
		Cur	mulative

Easement Acreage <sup>2</sup>	11.6					
Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Easement Acreage
4. Invasive Areas of Concern <sup>4</sup>	None	1000 SF	none	0	0.00	0.0%
5. Easement Encroachment Areas <sup>3</sup>	None	none	none	0	0.00	0.0%

1 = Enter the planted acreage within the easement. This number is calculated as the easement acreage minus any existing mature tree stands that were not subject to supplemental planting of the understory, the channel acreage, crossings or any other elements not directly planted as part of the project effort.

2 = The acreage within the easement boundaries.

3 = Encroachment may occur within or outside of planted areas and will therefore be calculated against the overall easement acreage. In the event a polygon is cataloged into items 1, 2 or 3 in the table and is the result of encroachment, the associated acreage should be tallied in the relevant item (i.e., item 1, 2 or 3) as well as a parallel tally in item 5.

4 = Invasives may occur in or out of planted areas, but still within the easement and will therefore be calculated against the overall easement acreage. Invasives of concern/interest are listed below. The list of high concern spcies are those with the potential to directly outcompete native, young, woody stems in the short-term (e.g. monitoring period or shortly thereafter) or affect the community structure for existing, more established tree/shrub stands over timeframes that are slightly longer (e.g. 1-2 decades). The low/moderate concern group are those species that generally do not have this capacity over the timeframes discussed and therefore are not expected to be mapped with regularity, but can be mapped, if in the judgement of the observer their coverage, density or distribution is suppressing the viability, density, or growth of planted woody stems. Decisions as to whether remediation will be needed are based on the integration of risk factors by DMS such as species present, their coverage, distribution relative to native biomass, and the practicality of treatment. For example, even modest amounts of Kudzu or Japanese Knotweed early in the projects history will warrant control, but potentially large coverages of Microstegium in the herb layer will not likley trigger control because of the limited capacities to impact tree/shrub layers within the timeframes discussed and the potential impacts of treating extensive amounts of ground cover. Those species with the "watch list" designator in gray shade are of interest as well, but have yet to be observed across the state with any frequency. Those in *red italics* are of particularly early in a projects monitoring history. However, areas of discreet, dense patches will of course be mapped as polygons. The symbology scheme below was one that was found to be helpful for symbolzing invasives polygons, particularly for situations where the condition for an area is somewhere between isolated specimens and dense, discreet patches. In any case, the point or polygon/

1 = The distributions for these parameters can include information from both the cross-section measurements and the longitudinal profile. 2 = For projects with a proximal USGS gauge in-line with the project reach (added bankfull verification - rare).

3. Utilizing XS measurement data produce an estimate of the bankfull floodplain area in acres, which should be the area from the top of bank to the toe of the terrace riser/slope.

## Appendix E HYDROLOGY DATA

Table 14. Verification of Bankfull Events Table 15. Groundwater Hydrology Data Groundwater Gauge Graphs

Date of Data Collection	Date of Occurrence	Method	Photo (if available)
June 3, 2020	May 21, 2020	Stream gauges and trail cameras captured a bankfull event after 5.37 inches of rain was documented between May 20th and 22nd, 2020 at an onsite rain gauge. Flow gauge recorded a stream stage of 2.15 feet.	1
November 18, 2020	November 12, 2020	Stream gauges and trail cameras captured a bankfull event after 3.1 inches of rain was documented between November 10th and 13th, 2020 at an onsite rain gauge. Flow gauge recorded a stream stage of 2.94 feet.	2, 3
