3.0 Executive Summary/Project Abstract

Project goals and objectives for the UT to Little Coharie Creek (Roseboro Site) Stream Restoration Project included:

Goal – Improve Water Quality

- i. Objective – Reduce nutrients entering the stream from livestock by fencing the conservation easement.
- ii. Objective – Reduce nutrient loads by planting a native riparian buffer.
- iii. Objective – Reduce water quality impacts from the adjacent aging sewer line by relocating the line and manholes away from the restored stream channel.

Goal - Improve Aquatic and Terrestrial Habitat

- i. Objective – Enhance instream habitat with woody debris and deep pools.
- ii. Objective – Construct a stable stream system that adequately conveys water and sediment.
- iii. Objective – Restore the riparian buffer by planting native species.

Goal – Reduce Erosion and Sedimentation

- i. Objective – Construct a stable stream system that adequately conveys water and sediment.
- ii. Objective – Restore the riparian buffer.
- iii. Objective – Establishment of a fenced conservation easement so that livestock does not enter the stream or the repaired riparian buffer.

The UT to Little Coharie Stream and Buffer Restoration Project restored and enhanced 2,330 feet of unnamed tributaries (UT's) to Little Coharie Creek and its riparian areas. The project is divided into two (2) stream reaches; the Main Reach and the Northern Reach. The Main Reach consists of 1,630 feet of stream restoration while the Northern reach totals 700 feet of stream enhancement.

Seven (7) permanent vegetation plots were established and used in annual vegetation monitoring. Vegetation plots VP3, VP4, and VP6 exceed the minimum success requirements. Vegetation monitoring plots VP1, VP2, VP5, and VP7 fall below the minimum success requirements. Additional random transect vegetation monitoring is recommended to collect additional data to determine planted stem density. For 2011, MY3, the vegetation monitoring identified stem counts below the minimum success criteria for MY3 resulting in an average density of 234 planted stems per acre for the entire site. The vegetative success criteria based on the US Army Corps of Engineers Stream Mitigation Guidelines (USACE, 2003) will require the survival of 260 5-year old planted woody stems per acre at the end of the year 5 monitoring period. UT to Little Coharie Creek utilizes a CVS Level 1 protocol for vegetation data collection. This protocol does not include volunteer stems during data collection, however, by visual observation, volunteer stems have been observed over the entire site. Vegetation plot locations are identified in Appendix C. Invasive vegetation species Chinese privet (*Ligustrum sinense*), mimosa (*Mimosa sp.*), kudzu (*Pueraria lobata*), and Asiatic daylily (*Commelina communis*) have been identified onsite and the location of each are depicted in Figure 2. Multiflora rose (*Rosa multiflora*) and fescue (*Festuca sp.*) have also been identified onsite.

Overall, the stream is functioning well and holding grade, however, the stream has areas that are of concern. Channel dimension and pattern are similar to as-built conditions and currently meeting monitoring minimum success requirement thresholds. The Main Reach channel profile appears to be holding grade and maintaining bedform features. The Northern Reach channel profile has areas that appear to have sediment deposition. This sediment deposition may be caused by vegetation growing within the bankfull channel. Since project construction, North Carolina has been in a moderate to severe

drought. The drought has caused low flow periods resulting in vegetation growing within the stream channel. Asiatic daylily and cattail are growing within the stream bed, causing disruption of sediment transport on parts of the project. Fencing along the ford crossings has trapped debris and may cause stream widening (Photo Station 6). It is recommended that fencing along the ford crossings be maintained annually to prevent additional damage.

In the Winter/Spring of 2011, a wild fire from an adjacent land parcel to the north of the Northern Tributary, caused damage to planted areas as well as easement fencing west of vegetation plot 6. Site damage was minimal but remedial repairs to easement fencing and vegetation plot 7 are required (Figure 2).

Wetland restoration or enhancement was not a part of the UT to Little Coharie Creek (Roseboro Site) Stream Restoration Site therefore no wetland monitoring is required.

Summary information/data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the mitigation and restoration plan documents available on EEP's website. All raw data supporting the tables and figures in the appendices is available from EEP upon request.

4.0 Methodology

Vegetative sample plots were quantitatively monitored during the growing season. Seven (7) 100m² plots were established for site monitoring. Species composition, density, vigor and survival were all monitored. Each plot corner is permanently located with rebar. Year 2 vegetation monitoring was completed in June 2011 utilizing the Carolina Vegetation Survey (CVS) – EEP protocol Level 1 (version 4.1).

Stream monitoring was completed by utilizing total station survey along with Rosgen Level II techniques to determine stream stability and performance. The annual cross-sectional survey included points surveyed at breaks in slope, including bankfull, inner berm, edge of water, and thalweg, if features were present. Longitudinal profile survey was conducted for the entire length of the restored channel for stream reaches. Measurements included thalweg, water surface, and bankfull. Existing onsite benchmarks were used for survey control.

Photo monitoring was conducted by walking each stream reach and taking photos at each predetermined photo point location using a digital camera.

APPENDIX A

Directions to Little Coharie Stream Restoration Site:
 From Raleigh take I-40 East to I-95 South. Take I-95 to exit 73 for US-421/ NC 55 toward Dunn/ Clinton. Follow US-421 South for 14 miles. Turn right at NC 242 (Salemburg Hwy). Continue on NC 242 South for 13 miles, the project site will be on the right just before Roseboro First Baptist Church.

Database Name	RKK_UTLittleCoharie-2010-B.mdb
Database Location	C:\Documents and Settings\pstafford\Desktop\CVS Veg Data
Computer Name	STAFFORDP

Description Worksheets In This Document

Metadata	Description of database file, the report worksheets, and a summary of project(s) and project data.
Proj, planted	Each project is listed with its PLANTED stems per acre, for each year. This excludes live stakes.
Proj, total stems	Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems.
Plots	List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.).
Vigor	Frequency distribution of vigor classes for stems for all plots.
Vigor by Spp	Frequency distribution of vigor classes listed by species.
Damage	List of most frequent damage classes with number of occurrences and percent of total stems impacted by each.
Damage by Spp	Damage values tallied by type for each species.
Damage by Plot	Damage values tallied by type for each plot.
Planted Stems by Plot and Spp	A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded.

Table 11a. Monitoring Data - Dimensional Morphology Summary (Dimensional Parameters – Cross Sections)

UT to Little Coharie Stream Restoration Project - EEP No. 314 Segment/Reach: Main Reach

*It is uncertain if the monitoring datum has been consistent over the monitoring history, which may influence calculated values. Additional data from a prior performer is being acquired to provide confirmation. Values will be recalculated in a future submission based on a consistent datum if determined to be necessary.

Biological or Other																																			

Shaded cells indicate that these will typically not be filled in.

1 = The distributions for these parameters can include information from both the cross-section surveys and the longitudinal profile.

2 = Proportion of reach exhibiting banks that are eroding based on the visual survey from visual assessment table

3 = Riffle, Run, Pool, Glide, Step; Silt/Clay, Sand, Gravel, Cobble, Boulder, Bedrock; dip = max pave, disp = max subpave

4. = Of value/needed only if the n exceeds 3
