### **3.0 Executive Summary/Project Abstract**

Project goals and objectives for the UT to Little Coharie Creek (Roseboro Site) Stream Restoration Project included:

#### **Goal – Improve Water Quality**

- i. Objective – Reduce nutrients entering the stream from livestock by fencing the conservation easement.
- ii. Objective – Reduce nutrient loads by planting a native riparian buffer.
- iii. Objective – Reduce water quality impacts from the adjacent aging sewer line by relocating the line and manholes away from the restored stream channel.

#### **Goal - Improve Aquatic and Terrestrial Habitat**

- i. Objective – Enhance instream habitat with woody debris and deep pools.
- ii. Objective – Construct a stable stream system that adequately conveys water and sediment.
- iii. Objective – Restore the riparian buffer by planting native species.

#### **Goal – Reduce Erosion and Sedimentation**

- i. Objective – Construct a stable stream system that adequately conveys water and sediment.
- ii. Objective – Restore the riparian buffer.
- iii. Objective – Establishment of a fenced conservation easement so that livestock does not enter the stream or the repaired riparian buffer.

The UT to Little Coharie Stream and Buffer Restoration Project restored and enhanced 2,330 feet of unnamed tributaries (UT's) to Little Coharie Creek and its riparian areas. The project is divided into two (2) stream reaches; the Main Reach and the Northern Reach. The Main Reach consists of 1,630 feet of stream restoration while the Northern reach totals 700 feet of stream enhancement.

Seven (7) permanent vegetation plots were established and used in annual vegetation monitoring. Vegetation plots VP3, VP4, and VP6 exceed the minimum success requirements. Vegetation monitoring plots VP1, VP2, VP5, and VP7 fall below the minimum success requirements. Additional random transect vegetation monitoring is recommended to collect additional data to determine planted stem density. By visual observation, a majority of the site is diverse and numerous of planted stems species. For 2012, MY4, the vegetation monitoring identified stem counts below the minimum success criteria for MY4 resulting in an average density of 234 planted stems per acre for the entire site. The vegetative success criteria based on the US Army Corps of Engineers Stream Mitigation Guidelines (USACE, 2003) will require the survival of 260 planted woody stems per acre at the end of the year 5 monitoring period. UT to Little Coharie Creek utilizes a CVS Level 2 protocol for vegetation data collection. This protocol does include volunteer stems during data collection. For vegetation success criteria, only the planted stems are used to determine stems per acre. Vegetation plot locations are identified in Appendix C. Invasive vegetation species Chinese privet (*Ligustrum sinense*), mimosa (*Mimosa sp.*), kudzu (*Pueraria lobata*), and Asiatic daylily (*Commelina communis*) have been identified onsite and the location of each are depicted in Figure 2. Multiflora rose (*Rosa multiflora*) and fescue (*Festuca sp.*) have also been identified onsite.

Overall, the stream is functioning well and holding grade, however, the stream has areas that are of concern. Channel dimension and pattern are similar to as-built conditions and currently meeting monitoring minimum success requirement thresholds. The Main Reach channel profile appears to be holding grade and maintaining bedform features. Due to sediment influx from upstream and offsite, there has been some aggradation of sediment in the upstream section of the Main Reach. Specifically, station

10+00 to 300+00. The Northern Reach channel profile has areas that appear to have sediment deposition also. This sediment deposition may be caused by vegetation growing within the bankfull channel. Since project construction, North Carolina has been in a moderate to severe drought. The drought has caused low flow periods resulting in vegetation growing within the stream channel. Asiatic daylily and cattail are growing within the stream bed, causing disruption of sediment transport on parts of the project..

In the Winter/Spring of 2011, a wild fire from an adjacent land parcel to the north of the Northern Tributary, caused damage to planted areas as well as easement fencing west of vegetation plot 6. Site damage was minimal and repairs to easement fencing were completed during 2012.

Wetland restoration or enhancement was not a part of the UT to Little Coharie Creek (Roseboro Site) Stream Restoration Site therefore no wetland monitoring is required.

Summary information/data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the mitigation and restoration plan documents available on EEP's website. All raw data supporting the tables and figures in the appendices is available from EEP upon request.

#### **4.0 Methodology**

Vegetative sample plots were quantitatively monitored during the growing season. Seven (7) 100m<sup>2</sup> plots were established for site monitoring. Species composition, density, vigor and survival were all monitored. Each plot corner is permanently located with rebar. Year 4 vegetation monitoring was completed in October utilizing the Carolina Vegetation Survey (CVS) – EEP protocol Level 2 (version 4.1).

Stream monitoring was completed by utilizing total station survey along with Rosgen Level II techniques to determine stream stability and performance. The annual cross-sectional survey included points surveyed at breaks in slope, including bankfull, inner berm, edge of water, and thalweg, if features were present. Longitudinal profile survey was conducted for the entire length of the restored channel for stream reaches. Measurements included thalweg, water surface, and bankfull. Existing onsite benchmarks were used for survey control.

Photo monitoring was conducted by walking each stream reach and taking photos at each predetermined photo point location using a digital camera.

## ***APPENDIX A***

Directions to Little Coharie Stream Restoration Site:  
 From Raleigh take I-40 East to I-95 South. Take I-95 to exit 73 for US-421/ NC 55 toward Dunn/ Clinton. Follow US-421 South for 14 miles. Turn right at NC 242 (Salemburg Hwy). Continue on NC 242 South for 13 miles, the project site will be on the right just before Roseboro First Baptist Church.

\*It is uncertain if the monitoring datum has been consistent over the monitoring history, which may influence calculated values. Additional data from a prior performer is being acquired to provide confirmation.

Values will be recalculated in a future submission based on a consistent datum if determined to be necessary.

\*It is uncertain if the monitoring datum has been consistent over the monitoring history, which may influence calculated values. Additional data from a prior performer is being acquired to provide confirmation. Values will be recalculated in a future submission based on a consistent datum if determined to be necessary.

<sup>3</sup> d16 / d35 / d50 / d84 / d95 /																																
<sup>2</sup> % of Reach with Eroding Banks																																
Channel Stability or Habitat Metric																																
Biological or Other																																

Shaded cells indicate that these will typically not be filled in.

1 = The distributions for these parameters can include information from both the cross-section surveys and the longitudinal profile.

2 = Proportion of reach exhibiting banks that are eroding based on the visual survey from visual assessment table

3 = Riffle, Run, Pool, Glide, Step; Silt/Clay, Sand, Gravel, Cobble, Boulder, Bedrock; dip = max pave, disp = max subpave

4. = Of value/needed only if the n exceeds 3
