## 1.0 EXECUTIVE SUMMARY

The following report summarizes the vegetation establishment and stream stability for Year 5 monitoring for the UT to the Lumber River Site in Robeson County, North Carolina.

### 1.1 Goals and Objectives

The primary goals of the UT to the Lumber River stream restoration project focus on:

- Improving water quality
- Providing/enhancing flood attenuation
- Restoring/enhancing aquatic and riparian habitat function and connectivity with adjacent pristine habitats
- Assisting the State of North Carolina initiatives along the Lumber River for conservation, including assisting the EEP with meeting its goals of improving water quality and habitat as documented within the Lumber River/Bear Swamp Watershed Management Plan for the Targeted 03040203030010 14-digit Hydrologic Unit.

These goals will be achieved through the following objectives:

- Restore the UT to a stable, more natural sand bed channel.
- Excavate a floodplain and connect flood flows to existing ponds for attenuation.
- Enhance in stream habitat by creating an undulating bedform.
- Establish a vegetated riparian buffer for nutrient and sedimentation reduction.
- Create three stormwater BMPS on three existing ditches to reduce sedimentation and nutrients from contributing waters.
- Connect the Lumber River with a habitat corridor through the existing agricultural fields through a conservation easement, riparian plantings, and stream restoration.
- Preserve much of the Lumber River and its floodplain through a conservation easement to protect habitat and water quality benefits of a mature floodplain and riverine system.

### 1.2 Vegetation

After the fifth growing season, bare root and live stake plantings are meeting and exceeding success criteria goals. Each of the 14 vegetation plots met the success criteria of at least 2260 stems per acre. The species planted include river birch (*Betula nigra*), green ash (*Fraxinus pennsylvanica*), sycamore (*Platanus occidentalis*), black willow (*Salix nigra*), silky dogwood (*Corunus amomum*), water oak (*Quercus nigra*), willow oak (*Quercus phellos*), and button bush (*Cephalanthus occidentals*).

Areas previously noted to have sparse ground cover and minor erosion are forming moss and becoming increasingly stable. (See Current Condition Plan View (CCPV) map). Additionally, bare root plants along the side slopes are continuing to survive and provide further stability to the soil along the slopes. Remaining areas of minor erosion are not expected to be issues of concern

in the future as the vegetation continues to mature. Additional seeding or planting is not recommended.

Isolated areas of invasive/exotic plant species were observed; however, the invasive species do not seem to be out-competing the natural or planted vegetation and no corrective action is recommended at this time. Invasive/exotic vegetation is not expected to compromise the vegetative success of the site in the future.

Previous mowing occurring within the easement along Deep Branch Road underneath the power line appears to have ceased.

**Figure 1.0 Evidence that mowing has ceased underneath power line**

Beaver activity was observed in the channel near station 24+50, and a small beaver dam affected vegetation between stations 24+50 and 25+25. The beavers were removed in the spring of 2014 and woody vegetation is expected to regenerate in the absence of the beaver dam. Additional planting is not recommended at this time.

**Figure 1.1 Vegetation affected by beaver compound**

### **1.3 Stream Stability**

The UT to the Lumber River appears to be stable and functioning as designed. Surveys do not show significant change to channel dimension, profile or pattern, and cross-sectional data confirms that the channel has experienced little change in dimension. Minor shifting of pools and sediment depositions are occurring; however, such changes in profile are expected in a dynamic, sand bed channel, and we expect excess sediment to be flushed out in future high flow storm events. Table 5, Visual Stream Morphology Stability Assessment, details 53 pools that are “stable, performing as intended”. The as-built profile depicted 63 pools. This would give a 84 percent rate of “stable, performing as intended” for Year 5 Monitoring, up from 75 percent for Year 4 Monitoring, 94 percent for Year 3 Monitoring, 92 percent for Year 2 Monitoring, and 76 percent for Year 1. These numbers are expected to continue to fluctuate in a sand bed system and it is our opinion that the channel is performing as it should.

The stream bed appears to have scoured between stations 42+00 through 44+00. It is unclear what caused this scour but based on field observations, there is no evidence of stream bank erosion or mass wasting in this area.

During Year 5 stream surveys a beaver dam was identified near station 24+50. This dam backed water up throughout the upper reach, leading to a water surface slope that is not indicative of normal circumstances. The dam was removed in the spring of 2014 and had no effect on the stability of the stream after Year 5 Monitoring.

The site has experienced several bankfull flows throughout the fifth year of monitoring. On-site crest gauges revealed that a bankfull event occurred at least twice during 2014. Rainfall exceeded one inch three separate times (January 12, February 13, and March 7) in the first quarter of 2014 and precipitation totaled 0.902 inches on April 19, 2014. Because bankfull events were not witnessed in person, dates can only be estimated based on rainfall data. Evidence of bankfull events can be found in Appendix E.

### **1.4 Wetlands**

No wetland monitoring areas were established for this project report.

### **1.5 Note**

Summary information/data related to the occurrence of items such as beaver or encroachment and statistics related to performance of various project and monitoring elements can be found in the tables and figures in the report appendices. Narrative background and supporting information formerly found in these reports can be found in the Baseline Monitoring Report (formerly Mitigation Plan) and in the Mitigation Plan (formerly the Restoration Plan) documents available on EEP’s website. All raw data supporting the tables and figures in the appendices is available from EEP upon request.

## 2.0 METHODOLOGY

The Year 5 Monitoring survey was completed using a Total Station. Each cross section is marked with two rebar monuments at their beginning and ending points. The rebar has been located vertically and horizontally in NAD 83-State Plane. Surveying these monuments throughout the Site ensured proper orientation. The survey data was imported into MicroStation for verification. The longitudinal stationing was developed from total station data and compared with previous year's data to ensure consistent beginning and ending points. RIVERMorph and Dan Mecklenburg's The Reference Reach Spreadsheet Version 4.3L was used to analyze the profile and cross section data. Tables and figures were created using Microsoft Excel.

The channel is entirely a sand bed system; therefore, a pebble count was not conducted. It should be noted that the restored channel is dominated by sand, not detritus as was the case in pre-restoration conditions.

Vegetation monitoring was completed using CVS level II methods, for 14, 100 square meter vegetation plots (Lee et al. 2006). The taxonomic standard for vegetation used for this document was Flora of the Southern and Mid-Atlantic States (Weakley 2011).

<b>Totals</b>	<b>11,022</b>			<b>67.2</b>			

<b>Mitigation Unit Summary</b>			
Stream	Restoration (SMU)	Enhancement (SMU)	Preservation (SMU)
UT	4,285.0	185.2	435.4
Lumber River			824.6
<b>Total (SMU)</b>	<b>5730.2</b>		

*The as-built stationing on UT Lumber River is 22 feet longer than the proposed channel design stationing (53+35 for design and 53+57 for as-built). The contractor stabilized an additional 22 feet of channel past the designed end point during construction to complete the tie in from the design channel to the existing channel. This area was shown in the as-built, but is not considered a major modification in the channel design.*

**Table 5. Visual Stream Morphology Stability Assessment**  
**UT to the Lumber River Site, 002027**  
**UT to the Lumber River: 4,285 feet**

Major Channel Category	Channel Sub-Category	Metric	Number Stable, Performing as Intended	Total Number in As-built	Number of Unstable Segments	Amount of Unstable Footage	% Stable, Performing as Intended	Number with Stabilizing Woody Vegetation	Footage with Stabilizing Woody Vegetation	Adjusted % for Stabilizing Woody Vegetation
1. Bed	1. Vertical Stability (Riffle and Run units)	1. <u>Aggradation</u> - Bar formation/growth sufficient to significantly deflect flow laterally (not to include point bars)			0	0	100%			
		2. <u>Degradation</u> - Evidence of downcutting			0	0	100%			
	2. Riffle Condition	1. <u>Texture/Substrate</u> - Riffle maintains coarser substrate	All	N/A		100%				
	3. Meander Pool Condition	1. <u>Depth</u> Sufficient	53	63		84%				
		2. <u>Length</u> appropriate	53	63		84%				
	4. Thalweg Position	1. Thalweg centering at upstream of meander bend (Run)	All	N/A		100%				
2. Thalweg centering at downstream of meander (Glide)		All	N/A	100%						
2. Bank	1. Scoured/Eroding	Bank lacking vegetative cover resulting simply from poor growth and/or scour and erosion			0	0	100%	N/A	N/A	N/A
	2. Undercut	Banks undercut/overhanging to the extent that mass wasting appears likely. Does <u>NOT</u> include undercuts that are modest, appear sustainable and are providing habitat.			0	0	100%	N/A	N/A	N/A
	3. Mass Wasting	Bank slumping, calving, or collaps			0	0	100%	N/A	N/A	N/A
<b>Totals</b>					0	0	100%	N/A	N/A	N/A
3. Engineered Structures	1. Overall Integrity	Structures physically intact with no dislodged boulders or logs	4	4			100%			
	2. Grade Control	Grade control structures exhibiting maintenance of grade across the sill.	3	3			100%			
	2a. Piping	Structures lacking any substantial flow underneath sills or arms.	3	3			100%			
	3. Bank Protection	Bank erosion within the structures extent of influence does <u>not</u> exceed 15%. (See guidance for this table in EEP monitoring guidance document)	4	4			100%			
	4. Habitat	Pool forming structures maintaing - Max Pool Depth : Mean Bankfull Depth ratio > 1.6 Rootwads/logs providing some cover at base-flow.	4	4			100%			

**Table 6. Vegetation Condition Assessment**  
**UT to the Lumber River Site, 002027**  
**UT to the Lumber River: 4,285 feet**

Planted Acreage = 15.0						
Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Planted Acreage
<b>1. Bare Areas</b>	Very limited ground cover (grass).	All bare or sparse areas were mapped.	See legend on CCPV (includes thin grass, no grass, and minor wash areas).	34	0.87	5.8
<b>2. Low Stem Density Areas</b>	Woody stem densities clearly below target levels based on MY3, 4, or 5 stem count criteria.	None	N/A	N/A	N/A	N/A
<b>3. Areas of Poor Growth Rates or Vigor</b>	Areas with woody stems of a size class that are obviously small given the monitoring year.	None	N/A	N/A	N/A	N/A
Easement Acreage = 67.85						
Vegetation Category	Definitions	Mapping Threshold	CCPV Depiction	Number of Polygons	Combined Acreage	% of Planted Acreage
<b>4. Invasive Areas of Concern</b>	Areas or points (if too small to render as polygons at map scale).	All populations were mapped	See legend on CCPV	14	0.06	0.4
<b>5. Easement Encroachment Areas</b>	Areas or points (if too small to render as polygons at map scale).	None	N/A	N/A	N/A	N/A

**Table 8. CVS Vegetation Metadata**

<b>Report Prepared By</b>	Ryan Smith
<b>Date Prepared</b>	8/25/2014 16:06
<b>database name</b>	CVS_entry - 2013.mdb
<b>database location</b>	S:\Lumber_River\Docs\Monitoring
<b>computer name</b>	NC10493
<b>file size</b>	41660416
<b>DESCRIPTION OF WORKSHEETS IN THIS DOCUMENT-----</b>	
<b>Metadata</b>	Description of database file, the report worksheets, and a summary of project(s) and project data.
<b>Proj, planted</b>	Each project is listed with its PLANTED stems per acre, for each year. This excludes live stakes.
<b>Proj, total stems</b>	Each project is listed with its TOTAL stems per acre, for each year. This includes live stakes, all planted stems, and all natural/volunteer stems.
<b>Plots</b>	List of plots surveyed with location and summary data (live stems, dead stems, missing, etc.).
<b>Vigor</b>	Frequency distribution of vigor classes for stems for all plots.
<b>Vigor by Spp</b>	Frequency distribution of vigor classes listed by species.
<b>Damage</b>	List of most frequent damage classes with number of occurrences and percent of total stems impacted by each.
<b>Damage by Spp</b>	Damage values tallied by type for each species.
<b>Damage by Plot</b>	Damage values tallied by type for each plot.
<b>Planted Stems by Plot and Spp</b>	A matrix of the count of PLANTED living stems of each species for each plot; dead and missing stems are excluded.
<b>ALL Stems by Plot and spp</b>	A matrix of the count of total living stems of each species (planted and natural volunteers combined) for each plot; dead and missing stems are excluded.
<b>PROJECT SUMMARY-----</b>	
<b>Project Code</b>	94068
<b>project Name</b>	UT to the Lumber River
<b>Description</b>	Stream Restoration, Enhancement and Preservation Site
<b>River Basin</b>	Lumber
<b>length(ft)</b>	4285
<b>stream-to-edge width (ft)</b>	75
<b>area (sq m)</b>	59707
<b>Required Plots (calculated)</b>	14

It should be noted that As-built conditions were completed at the end of construction. Many storm events had occurred between beginning of construction and end of construction that naturally modified constructed parameters.  
 \*50 foot easement crossing is taken out of the stationing to get 3,123 linear feet of construction.

Channel Stability or Habitat Metric																		
Biological or Other																		

Shaded cells indicate that these will typically not be filled in.

1 = The distributions for these parameters can include information from both the cross-section surveys and the longitudinal profile.

2 = Proportion of reach exhibiting banks that are eroding based on the visual survey from visual assessment table

3 = Riffle, Run, Pool, Glide, Step; Silt/Clay, Sand, Gravel, Cobble, Boulder, Bedrock; dip = max pave, disp = max subpave

4 = Of value/needed only if the n exceeds 3

<sup>3</sup> R% / P%	49.3 / 50.7			48.7 / 51.3			46.1 / 53.9			44.3 / 55.7			53.8 / 46.2			43.7/56.3		
<sup>3</sup> SC% / Sa% / G% / C% / B% / Be%																		
<sup>3</sup> d16 / d35 / d50 / d84 / d95																		
<sup>2</sup> % of Reach with Eroding Banks																		
Channel Stability or Habitat Metric																		
Biological or Other																		

Shaded cells indicate that these will typically not be filled in.

\*50 foot easement crossing is taken out of the stationing to get channel thalweg length.

1 = The distributions for these parameters can include information from both the cross-section surveys and the longitudinal profile.

2 = Proportion of reach exhibiting banks that are eroding based on the visual survey from visual assessment table

3 = Rifle, Run, Pool, Glide, Step; Silt/Clay, Sand, Gravel, Cobble, Boulder, Bedrock; dip = max pave, disp = max subpave

4 = Of value/needed only if the n exceeds 3

**Appendix E. Hydrologic Data**

**Table 13. Verification of Bankfull Events**

Date	Crest Gauge Info		Gauge Reading (ft)	Gauge Elevation (ft)	Crest Elevation (ft)	Bankfull Elevation (ft)	Height above Bankfull (ft)	Photo
	Site	Sta.
