

## MEMORANDUM

---

**To:** Billy Meyer  
**From:** Christie Zawtocki, PE  
Timothy Klotz  
**Date:** June 13, 2014  
**Project:** One Hour Martinizing Site, DSCA ID 32-0013  
1103 W Club Blvd, Durham, NC  
**Subject:** Monthly Update

---

Hart & Hickman, PC (H&H) is proceeding with implementation of the Remedial Action Plan (RAP) for the One Hour Martinizing site. The groundwater remedial action, which consisted of injecting EHC into the source area aquifer, was completed at the site between January 8 and 25, 2014. An *EHC Injection Report* was submitted to the DSCA Program on March 31, 2014, and post-injection sampling activities and results have been described in the monthly updates. A brief summary of recent post-injection sampling activities is provided below. An updated project calendar is provided in Attachment A.

### ***Soil Vapor Field Screening***

H&H completed a post-injection soil vapor field screening event at the site on May 22, 2014. The event included measuring total volatile organic compounds (VOCs), methane, carbon dioxide, and oxygen in soil vapor, indoor air, and outdoor ambient air. The primary purpose of the sampling is to confirm methane levels are within acceptable standards. Measurements were scheduled to be collected at the following locations:

- Soil Vapor Monitoring Points: SV-8S/8I, SV-18S, SV-19S, SV-20S/D, SV-29S, SV-55S/I
- Excavation Vent Exhaust Pipe
- Sub-Slab Depressurization (SSD) System Exhaust and Indoor Air at 1414 Watts St (Triangle Family Church)
- Ambient, Outdoor Air on Source Property

Measurements could not be collected from SV-55I due to moisture/lack of air flow and could not be collected from the sub-slab depressurization system exhaust at the Triangle Family Church. Additional measurements were collected from SV-14, SV-21S/D, SV-27S, SV-28D, SV-29D, and SV-49S/D. The field screening data are summarized in the attached Table 1, and the methane readings collected between May 2013 and May 2014 are shown on the attached Figure 1. Recorded field measurements indicate that methane was detected in two of the sampled soil

vapor points located near the source excavation area at low levels of 0.3% by volume (SV-8I) and 0.1% by volume (SV-55S), during the May 2014 sampling event. These methane readings are well within acceptable levels.

Methane was detected at a concentration of 4.2% by volume in the vapors from the excavation passive exhaust vent during the May 2014 sampling event. These vapors are exhausted into the atmosphere through the stack installed on the source property where they dissipate into the atmosphere. Ambient air monitoring conducted near ground level in the immediate vicinity of the exhaust vent did not detect any measurable methane.

VOCs were detected in each of the monitored soil vapor points, except for SV-19. In general, the soil vapor VOC concentrations are lower than the pre-injection concentrations at most sampling locations. The highest VOC concentration was detected in deep soil vapor point SV-29D (1019 ppm) located on the 1419 Dollar Ave property east/southeast of the source property. The shallow soil gas at this location had a much lower VOC concentration of 22.3 ppm (SV-29S).

### ***Indoor Air Monitoring***

In April and May 2014, H&H collected post-injection indoor air samples at the three structures adjacent to the source property where vapor mitigation systems are in place (1419 Dollar Ave, 1421 Dollar Ave, and 1414 Watts St). The April 2014 samples were collected with the original vapor mitigation systems in place, and the May 2014 samples were collected following installation of additional vapor mitigation measures. In May 2014, the mitigation systems at 1419 and 1421 Dollar Ave were modified to include sub-membrane depressurization in the crawlspaces and sub-slab depressurization in the basements. The mitigation system at 1414 Watts St was modified to include additional sub-slab vapor extraction points and vent fans.

On April 13, 2014 and May 25, 2014, H&H collected two Summa canister indoor air samples from the Triangle Family Church at 1414 Watts St during the church's Sunday service. The samples were collected over a time period of two to three hours. For the residences at 1419 and 1421 Dollar Ave, H&H collected two 24-hour Summa canister indoor air samples in April 2014 and two 14-day indoor air samples using passive Radiello sampling devices. In May 2014, H&H collected two 14-day indoor air samples from the 1419 and 1421 Dollar Ave residences using passive Radiello sampling devices. The sampling dates are shown on the attached calendar for both April and May. The results for the May 2014 samples collected at 1419 and 1421 Dollar Ave are not yet available.

The indoor air samples were submitted for laboratory analysis of tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-dichloroethene, trans-1,2- dichloroethene, and vinyl chloride. The analytical results for the indoor air samples are summarized in Table 2 and presented on Figure 2. Please note that the May 2014 indoor air sample results for 1419 and 1421 Dollar Ave will be provided in the next monthly update.

PCE was detected in each of the indoor air samples collected at 1414 Watts St at concentrations of 11  $\mu\text{g}/\text{m}^3$  (1414-Front) and 43  $\mu\text{g}/\text{m}^3$  (1414-Rear) in April 2014 and at concentrations of 1.9  $\mu\text{g}/\text{m}^3$  (1414-Front) and 2.2  $\mu\text{g}/\text{m}^3$  (1414-Rear) in May 2014. TCE was also detected at an estimated concentration of 0.072  $\mu\text{g}/\text{m}^3$  (1414-Front) in the April 2014 sample. The May 2014 indoor air concentrations at the Triangle Family Church are the lowest concentrations detected to date indicating that the mitigation system improvements are effectively reducing indoor air concentrations. To evaluate the risk associated with the detected indoor air concentrations, H&H evaluated a residential exposure scenario assuming 6 hours per week of exposure time, which is typical of a Triangle Family Church parishioner. As shown in the worksheets provided in Attachment B, the calculated cumulative carcinogenic risk levels range from  $7.5 \times 10^{-9}$  to  $1.7 \times 10^{-7}$  and the hazard index levels range from 0.0017 and 0.04. These risk levels are well within acceptable levels.

PCE was detected in each of the indoor air samples collected from the residences at 1419 Dollar Ave (ranging from 5.9  $\mu\text{g}/\text{m}^3$  to 24  $\mu\text{g}/\text{m}^3$ ) and 1421 Dollar Ave (ranging from 1.9  $\mu\text{g}/\text{m}^3$  to 4.8  $\mu\text{g}/\text{m}^3$ ). The PCE concentrations detected in the 24-hour samples (April 15, 2014) from 1419 Dollar Ave exceed the DWM Residential Indoor Air Screening Level of 8.34  $\mu\text{g}/\text{m}^3$ . TCE was not detected in any of the 24-hr indoor air samples, but was detected in two of the 14-day samples at concentrations of 1.2  $\mu\text{g}/\text{m}^3$  (1419-UP) and 0.47  $\mu\text{g}/\text{m}^3$  (1421-UP). The detected TCE concentrations exceed the DWM Residential Indoor Air Screening Level of 0.43  $\mu\text{g}/\text{m}^3$ . H&H calculated the risk associated with the detected indoor air concentrations. As shown in the worksheets in Attachment C, the carcinogenic risk levels are less than  $1 \times 10^{-5}$  and the hazard index levels are less than 1.

### ***Future Sampling Activities***

A project calendar identifying planned sampling activities through January 2015 is provided in Attachment A. Details regarding the planned sampling activities were provided in the May 13, 2014 update. The next sampling activities include monthly methane field screening and indoor air sampling events in June 2014.

Notes:

1. VOC concentrations measured using a photoionization detector (PID)
2. Methane, carbon dioxide, and oxygen concentrations measured using GEM 2000 multi-gas meter.
3. NM denotes not measured; NA denotes not available.

**DSCA ID No:**

32-0013

**Name/Address of DSCA Site:**

One Hour Martinizing, 1103 West Club Blvd, Durham, NC

**Name/Address of Sampling Location:**

Drey Residence, 1419 Dollar Ave, Durham, NC

**Sampling Date:**

4/15/2014

**Sample ID:**

1419-UP

CAS	Chemical Name	Indoor Air Concentration	Target Indoor Air Conc. for Carcinogens @ TCR = 1E-06	Target Indoor Air Conc. for Non-Carcinogens @ THQ = 0.2	Calculated Carcinogenic Risk	Calculated Non-Carcinogenic Hazard Quotient
		(ug/m <sup>3</sup> )	(ug/m <sup>3</sup> )	(ug/m <sup>3</sup> )	CR	HI
127-18-4	Tetrachloroethylene	9.6	9.36E+00	8.34E+00	1.03E-06	0.2301
					Cumulative:	1.03E-06
						0.23

Notes:

1. Target indoor air concentrations calculated using the EPA Vapor Intrusion Screening Level (VISL) Calculator, which is based on the EPA Regional Screening Levels. Note that concentrations are equivalent to the Inactive Hazardous Sites Branch (IHSB) VISLs.
2. Cumulative carcinogenic risk (CR) and hazard index (HI) calculated using the following formulas, per the procedure detailed in the EPA Regional Screening Levels User's Guide.

$$CR = [(Conc_x/SL_x) + (Conc_y/SL_y) + (Conc_z/SL_z)] \times 10^{-6}$$

Where,

Conc = indoor air concentration for constituent of concern

SL = target indoor air concentration for constituent of concern based on carcinogenic risk of  $10^{-6}$

$$HI = [(Conc_x/SL_x) + (Conc_y/SL_y) + (Conc_z/SL_z)]$$

Where,

Conc = indoor air concentration for constituent of concern

SL = target indoor air concentration for constituent of concern based on hazard quotient of 1\*

\* = Tabulated values are based on a hazard quotient of 0.2. These values are multiplied by 5 to convert to a hazard quotient of 1.

Notes:

1. Target indoor air concentrations calculated using the EPA Vapor Intrusion Screening Level (VISL) Calculator, which is based on the EPA Regional Screening Levels. Note that concentrations are equivalent to the Inactive Hazardous Sites Branch (IHSB) VISLs.
2. Cumulative carcinogenic risk (CR) and hazard index (HI) calculated using the following formulas, per the procedure detailed in the EPA Regional Screening Levels User's Guide.

$$CR = [(Conc_x/SL_x) + (Conc_y/SL_y) + (Conc_z/SL_z)] \times 10^6$$

Where,

Conc = indoor air concentration for constituent of concern

SL = target indoor air concentration for constituent of concern based on carcinogenic risk of  $10^{-6}$

$$HI = [(Conc_x/SL_x) + (Conc_y/SL_y) + (Conc_z/SL_z)]$$

Where,

Conc = indoor air concentration for constituent of concern

SL = target indoor air concentration for constituent of concern based on hazard quotient of 1\*

\* = Tabulated values are based on a hazard quotient of 0.2. These values are multiplied by 5 to convert to a hazard quotient of 1.
